Brief installation, removal, and operating instructions are included.

If there is enough interest, the Beta version may advance into a final version. In any event, I am not aware of any major bugs in the program.

Send your request to my e-mail at mktg@ix.netcom.com and I will send you the zip file by return e-mail.

Regards,

David

1675. Need "short verticle" antenna design for 6-meter talkie

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-09 00:00:00 UTC
From: Charlie Thompson <xctx@onr.com>
Message-ID: <79qc2c$n9g$1@news.onr.com>
Source record: 73698

I'm looking for a shortened 6-meter antenna for a handie talkie
application. About 3 feet is my ideal target length.

Does anyone have any good design references for such an antenna?

thanks in advance,

W5CDT

A scrap Pye Westminster, Vanguard, Cambridge or similar rig should yield
a 10.7MHz to 455KHz conversion board, fitted with either a 10245KHz or a
11155KHz xtal (beware - IIRC, some (?lowband) sets had a lower first IF,
so the rock will be on a different frequency). These sets, especially AM
ones, go for very low prices at rallies.

BTW, the conversion crystal frequency was chosen in order to avoid its
harmonics appearing on or near the Rx frequency, so that's a point to
bear in mind.

But the orginator of the thread wanted to do it with a PIC. (The '17 is
a 4 digit counter/display). The disadvantage of using a counter chip
like the Intersil 7216/7226 is that they are expensive or hard to get,
limited in frequency to 10 MHz, and (worst of all) are a total pain to
interface to anything else. Their output is the decoded multiplexed
drive for an LED dispaly

>> One of the hobby magazines had a PIC based frequency counter as a project
>> 3-6 years ago. I think it was Electronics Now.

Well, that was a merry chase. Turns out to be Popular Electronics,
November 1994. "Build a 50 MHz Frequency Counter" by Terry Weeder.

Typically ammonium bifluoride - and still fairly nasty. The vapors given off by the etching are also hazardous.

>Now, if one were to etch a series of circuit traces on a plate of glass,
>paint them with solder paste and then heat the whole thing to
>solder-melting point, would the melted solder paste wet and adhere to
>the etched glass? This and surface mount components would make a very
>interesting circuit board.

Likely not. The surface tension of the solder, and its non-wetting characteristic with glass would have the solder melt and produce little balls. Your best bet would be to sputter the traces using a conductive metal. The old silver mirror technique might work too; the problem here would be the silver dissolving into the solder.

I have a box of ceramic circuit board material. These have a thick layer of copper. The boards are pre-punched on 0.1" centers. The ceramic, however, is a dull gray color - not very pretty.

You can buy (or at least used to) Mylar circuit boards for flexible circuits. You have to use a low temperature solder and solder quickly with them, but you do end up with a transparent board.

Cirkit (UK) sell 10.245 MHz crystals. Price UKP 1.12, in the 1997 catalogue.
Order No. 45-10003. E-Mail mailorder@cirkit.co.uk

Some VHF 2-way radio's and cordless phones use 10.245 MHz crystals. Most
CB's use a 10.240 crystal, as the PLL reference. (10.240MHz / 1024 = 10KHz.)

Ah!, just found one in my junk box. It's yours if you want it.

Probably so. The Mini-Circuits ZEM-4300MH, for example, supports RF/LO signals between 300 and 4300 MHz, with an IF extending from DC-1000 MHz. As with most DBMs, it is possible to switch the LO/RF and IF ports, giving you RF response extending down to DC and IF response to the full mixer rating of 4300 MHz.

I've used a ZEM-4300MH as part of a homebrew tracking generator, with a +2 dBm 110 MHz LO injected at the IF port, a +2 dBm 2182 MHz signal at the RF port, and a 2072 MHz IF coming out through the LO port. Worked fine even though the LO injection was below spec, but this was a non-critical application with clean signals, fixed levels, and a really nice cavity filter in the output circuit. In other words, IMD and conversion loss were not important. In the final design I replaced the ZEM-4300MH with a cheaper PAM-42 model, with similar results.

Later on I did some quick IMD and conversion-loss tests on a reverse-connected ZEM-4300MH, and basically found no penalties with running the mixer that way. Note that my tests were conducted in the VHF-UHF range; for an IMD- or flatness-critical application you'd probably want to test at the actual frequencies of interest. I'd be curious to hear from anyone who's done more careful testing of IF/RF-reversed mixers, to see if my impressions are valid in the general case.

The Mini-Circuits catalog basically says "yes, you can do this," but they point out that a mixer operated with RF applied to its IF port is more vulnerable to damage caused by static electricity and so forth, due to the lack of transformer isolation.

Hello all.
As the resident company techno-geek, I get first dibs on all the stuff that's "too good to throw away" - this is a great example! This link-tester is designed to test and validate the coax and/or twisted-pair connections between IBM dumb terminals and their controllers. It consists of a hand-sized transmitter/receiver pair with digital readouts and BNC connectors, two power supplies, several cable adapters, and the user manual all in a foam lined hard-shell briefcase. Cost several thousand dollars new, and is 100% functional for what it was designed to do - it's just obsolete in a LAN environment.
As a ham, I looked at it and thought of all the things I could build inside the cases of the two testing units, not to mention a dozen uses for the foam padded briefcase. But since I've got no time to "play" these days, make me an offer. There's plenty of homebrew opportunities with this...the case alone is worth something! (And if by some chance you happen to run an IBM mainframe or AS400 shop you might actually be able to use the tool!)

73 and take care

I am resolved to build my own electronics keyer.

If anyone can help me to point me to a www site, (or assist me in however way) to construct an electronic keyer to compliment my homebrew paddle keyer, I will be most obliged.

Thank you.

Jamel

Good day, all,

Recently, I have begun to learn by experience all of the wonderful things I learned by education when I was studying for my ham license. I came across a couple of old Heathkit radios and decided to restore them, but don't know enough about the hordes of different kinds of components to make rational choices about replacement parts.
The radios date from the early 60s (SB-300 and SB-400), and the parts lists contain references to several types of capacitors, many of which are not available today. I have closely perused the Mouser and Digikey catalogs, but no luck on many of these. The questions follow in no particular order:

Several of the values for caps listed are not "standard" today (e.g., 7.5, 36 and 90 pf). Should I just use the next higher value that is available? Or perhaps the next lower?

Many of the caps listed are mica. I understand that mica provides a greater temperature stability, but they are pricier than I like. One source I have says that ceramics rated NP0 will work well for temperature stability. Is that true? What are the circumstances in which you would definitely want to use mica, instead of ceramic?

What about mylar? Polypropelene? Tantalum? What applications would these be best suited for?

What is the meaning of the various temperature coefficient ratings (NP0, Z5U, etc.)

The same question regarding EIA Class I, II, and III?

Trimmer caps - are these just adjustable capacitors?

Snubbers?

In power supply applications, I have seen some schematics that use monster electrolytic filter caps - 20K mf. The radios I am working on use 20 mf. What is the purpose of using such huge ratings? Is it just a better filter?

I would very much appreciate any responses that would help me to understand the nature of these beasties a bit better.

Thanks!

Adam Adkins, KM5SS

Do you have a single or double lever paddle?

The only keyer circuit I have found on the net is at:
http://www.qrp.pops.net/qrp/default.htm

I have built a simple keyer from "Solid State Design" published by the ARRL. It uses 3 NE555 timer chips, the entire circuit fits nicely on a Radio Shack 276-150 pc board. Very simple, and it works.

There are many other designs published in various book and magazines, and several current kits are available that are both cheap and easy to build, and have just about any feature you would want in a keyer. Here is a links page for parts and kits that include a couple of keyer kit vendors, it's fun just plowing thru all this stuff:

http://www.fix.net/~jparker/norcal/links/suplylinks.htm

Good luck with your project.

Hi! Is it relatively painless to install a PL board in a Midland 13-509? I have a ComSpec board that I would like to put it. I'm lacking docs, so any info would be helpful.

Are there any other upgrades of interest with this rig? I found an old article in "73 Magazine" about improving the squelch performance, but that's it. Has anyone ever changed out the finals to get more than 10W out (like is commonly done with the HR-2510/2600)?

Thanks for any help -

I've been wondering about oddball techniques for fabricating circuitry at home.

You can buy reasonably safe glass etching compounds now - still fluorine based but not HF, as I understand it. Some sort of paste material: apply, wait some nontrivial amount of time, wash off, done.

Now, if one were to etch a series of circuit traces on a plate of glass, paint them with solder paste and then heat the whole thing to solder-melting point, would the melted solder paste wet and adhere to the etched glass? This and surface mount components would make a very interesting circuit board.

I plan on trying this, of course, but I wonder if anyone out there has any first hand experience or directly applicable book learnin' and would be so kind as to share?

Note that I'm *only* interested in applying this technique to showpiece, home built, one-or-two-off items.

Particularly, I'm not worried about manufacturability or ease of construction except at the grossest level.

thanks and 73

I know this is off topic - but...

Can someone tell me the pinouts for a PC parallel port, the D type connector that is.

I am setting up a non pc computer to talk to a printer and need to make up a connector for it. It has a parallel port that will talk centronics but doesn't have a lead, so I'm going to make up a lead that connects to a PC lead. I just need to know what the various pins do.

>

Ditto.

> 3. Do NOT buy from a Radio Shack franchise (locally-owned) store,
> 'cause Radio Shack Headquarters apparently can't even ask it
> to correct a problem.
>

This I don't understand. The fact it was bought at a franchise store
should have made no difference. ANY corporate owned store can handle
problems with Radio Shack brand products, REGARDLESS of where they were
bought. They only thing they can't handle is non-Radio Shack products
purchased at franchise stores. I would suggest you contact them again.

> 4. Do NOT buy anything "big" (i.e., more than miscellaneous parts)
> from Radio Shack, period!
>

I really haven't had problems with their "big" products, but as you said,
mileage may vary.

>Roy Lewallen, W7EL

2x4's in that length might be hard to find, but 2x8's or larger CAN be found, and then ripped down to the desired dimension. If the final-dimension lumber is thoroughly treated, first with a good coat of copper sulphate, and then with 2 coats of linseed oil, followed by a finish cover coat of good exterior paint, it will be weather and trouble proof for YEARS! Use of stainless hardware and long deck screws instead of nails is a good idea too!

The company to which you refer used to stock 10.245 at a much lower
price. Might be worth checking, although they've largely dropped out of
the "off-the-shelf" aspect. This sort of thing used to be stocked by
Cirkit and maybe Maplin IIRC. Oh, and quite a few old Pye sets used
10.7MHz and 455kHz.

Robin: how many do you want and is the package important? I might be
able to liberate a few from the junk here...

According to the Merck Index, Indium is relatively non-toxic when
administered orally, but highly toxic intravenously or subcutaneously.

So don't shoot it up.

Nothing mentioned about vapors, though. I am a chemist and have
generally found indium to be regarded as a very low hazard element.

The climate here in western Oregon is pretty hard on outside wood, but my A-frame has lasted 15-20 years with nothing more than a couple of coats of deck stain. I've re-stained it maybe 3 or 4 times in that interval. It's also important to keep the wood off the ground. Otherwise, in this climate at least, it'll quickly rot and/or get infested with termites. I got 3 concrete pyramids -- the variety with a hole in the top -- at the local home-improvement store, and put a bolt into each, threads up, with a little concrete. The bottom board of the A-frame is drilled in three places for the bolts to stick through, and the A-frame is set down on the pyramids to keep it off the ground.

Why not use treated wood, Roy? It is sealed and termites don't
like it. "Treated" wood is rated for ground contact.

I'd rather just keep the wood off the ground than use wood laced with the toxic stuff used in pressure treating. That's a personal twitch, though, and treated wood should work o.k. if you're so inclined. I realize that the deck stain isn't lovely stuff, either.

Hello Gentlemen,

To all who responded, thanks for correcting me regarding the "HBR-12". Yes, I believe it was the HBR-16 that I had many moons ago. Too many years have gone by...hi

Does anyone out there have one of these that they are no longer interested in and would like for it to have a new home??

Thanks,
Chris KX0Y

Before you finalize the design on your home made wooden antenna support,
go to the lumberyard and get prices on various sizes of boards. You may
be pleasantly surprised to learn that LONGER pieces are sometimes
priced lower than shorter pieces because of supply and demand.

Rat Shack makes a couple of decent products. The HTX-202 is a clunky looking old 2M HT, but is nevertheless fairly popular due to its fairly rugged construction and reasonable price. I built one of their cheap CB SWR meters into a QRP rig once. It wasn't compact or pretty, but it was a simple hookup.

OTOH, I had a SWL Receiver from RS, I think the model # was DX-390 or DX-380. Anyway, it was a mid size portable with BFO and no casette recorder built in. I actually used this as my first ham receiver, in conjunction with a crystal transmitter using a 2n2222 and a 2n2222A. Actually made a few contacts with that clumsy lashup. Anyway, this was in a marine environment. The antenna was at about 85 feet. The static generated by the wind, spray, etc on my 40/15M dipole trashed the front end. There is evidently some pretty delicate pre-amp circuitry there. I eventually ran the feedline directly to the mixer and got it working again, though with rather reduced sensitivity. The antenna was about 180 feet away from the ship's MF and HF antennas, and full power out of the ship's gear was only about 6 amps on the wire. That really bummed me out. The audio was pretty decent out of that set, and it didn't cost all that much for a set with a BFO, but it just couldn't hang.

Sometimes it is nice to be able to run right in and buy a part or some wire, even at their prices. I am currently pondering designing a receiver built with just stuff that Rat Shack stocks. That might be tough, but it would be nice if a newbie homebrewer could just go there and buy all the parts for a project.

To all Group Members,

A group of collector-historians has recently formed the Tube Collectors Association. This is in response to the need for a focused group dedicated to the growing activity of collecting radio/wireless tubes and to sharing historical insight about them. As a tube enthusiast, you'll probably be interested in this development, and may want to help guide the activities of the group from the start.

For more on the Tube Collectors Association:

> Radio-Tech/waveguide http://www.users.zetnet.co.uk/ross/radio/

Hi, Jan-Martin

I change the issues this way: Type the year and month number in their fields

and type " * issue " in the "Article"-field.
If you want to change the month , simply change the month number , delete
the name of the month in the "Article"-field and type an * in front of the
word
" issue ". You can also mark the monthname with the mouse and overwrite it
with *.
This is the simplest way to change the year and month i have found.

You dont have to scan in your schematics, because they are on the CD in
TIFF-format
which is the normal scanner output format.
The files are organised in the following way:
On every CD are directories named with the last 2 digits of the year (i.e.

82 for 1982)
Each directory contains subdirectories named 1 to 12 (for the month)
The files are named this way: YYMMPPP.tif
where YY is the year (i.e. 82)
MM is the month (i.e. 03 for March)
PPP is the page number + 2 (i.e. 010 for page nr. 8)
(001 and 002 are the cover-pages)

So if your diagram is in the February 1950 issue on page 45, your file is:
X:\50\2\5002047.tif with X: as your CDROM drive:
You can convert tif to gif with most graphic-programs.

I hope this will help

You may be able to get away from chemical etching by using am air eraser (small sand blaster) The one I use is a paasche. The grit size is about 2400 (I think) aluminum oxide. I can make lines the width of a pencil line.

Then you could try silver print conductive paint for printed circuits. Fill the etched area with this.

I don't know if this will work. You might crack the glass when you solder to it. Just another input......

Good luck

john

I've seen these for sale in the Small Parts catalog (www.smallparts.com).
Interesting.
Do you use it inside a sandblasting box, or what?

> Then you could try silver print conductive paint for printed circuits.
> Fill the etched area with this.
>

The conductive silver paint is an interesting idea. Thanks. They also make
silver filled epoxy, I think. Anyone have any experience, good or bad, with
this stuff? Perhaps I could use the epoxy instead of soldering?

As far as cracking, I was thinking of using tempered glass, and soldering
with low-temp solder and a hot-air blower. I suppose hard glass might make
the sandblasting thing more difficult to do... also, I understand tempered
glass can shatter violently when drilled -- I wonder if this applies to
etching with a sandblaster too?

> Thanks, Greg K3EWZ
Greg,
It was a power fet made by Teledyne Crystalonics in Mass. Phone # was
(617)491 1670. I have no idea if the company is still in business.
This and the others in the series were designed for low IMD high dynamic
range vhf/hf RF amps in the common gate configuration, and were pretty
unique. I don't think there are any modern equivalents. The CP640 and
643 were often specified for high end RF stages around that time (for
example in Rhode's Transceiver design in Ham Radio magazine in 78)
You can get similar performance now in other ways but the simplicity of
the designs that these fets made possible was nice. A single grounded
gate fet with matching transformers gave you +40dBm Intercept, +20dBm 1
dB compression, a pretty good noise figure of 2.2 dB and a swr of less
than 1.5 to 1 from 0.5 to 50 MHz.

If you find an equivalent I'd be happy to hear about it!

73,

Dan AC6AO / G3NCR

>I'm planning on building some homebrew gear and I was woundering
>- can you make a pic controled oscillator?

Use a pulse width modulated output port to vary varactor. Better filter it good enough. You might even get the PIC to retune itself via its VCO.

I remember reading on the PIC mailing list a few years back about a PIC transmitter that used a harmonic of the CPU crystal as the transmitter frequency.

>- how do those PIC based frequency counter work?

The PIC has a prescaler on the counter-timer. After the frequency to be counted is gated into the prescaler via a port controlled NAND gate, another port line pulses the prescaler until it rolls over, to the value in it can be read too.

>- can you decode DTMF with a PIC

A subject of considerable debate on the PIC list a few years back. In short, a task for DSP but some cheap & dirty techniques (like pulse width modulation) may have been perfected. Check the PIC list archive.

>Also are there any websites with schematics for a 2 meter transciver
>or transmitter?

Probably. Once again, the PIC list archive.

Yep. You don't need two, just one. A state-variable active filter
provides quadrature outputs. One implementation mode of a switched
capacitor filter is the state-variable filter. Go to National
Semiconductors web site and find application notes on filters,
switched capacitor filters, and switched filter data sheets.

Early printed circuit boards where exactly that---printed.

They printed conductive paint directly on a ceramic substrate using a silk screening process.

This was invented during WW2 for use in electronic bomb fuses (the fuses being electronic, not the bombs), which needed to be rugged, compact, and mass producible, in addition to being reliable.

Don't remember the inventors name, but there was an article in CQ magazine last year about it.

You might be able to do the same thing with etched glass---the idea being to have something for the conductive paint to stick to.

But, why not try old fashioned point to point wiring? It should work for everything up to lower microwave frequencies if you are careful (and build subcircuits in separate boxes or compartments).

>

This is true.

I did not mention that I have built one myself. It is 36 ft tall and is
made out of combinations of 12 ft and 8 ft 2x4s.

The traditional A frame mast was made out of 2x2 lumber, but 2x4 is much
sturdier. I estimate that it will stand up to 100+ MPH winds with no
trouble (am using 5/16 inch steel guy wire and 4 ft anchors).

The reason I mentioned using 8 ft 2x4s is that the original poster wanted
something portable. An 8 ft piece would be much easier to carry around than
a 12 ft piece. In my case it was for fixed use.

By the way, I had originally planned on a 48 ft mast, but it proved too
heavy to erect, so I shortened it to 36 ft. Even then I had a total of 4
people to pull it up (including myself). I guesstimate that a 21 footer
would be no problem for 2 or three 'trained' people.

When I have used the sand blasting technique, I went outside put on
a respirator and face shield and went to work. This keep me from cleaning
up the shop and having to protect others from the oxide compound. Silica
compounds are hazordus to breath. I did not try to recover the blasting
compound. I did not have that much to etch.

I've built two A-frames, one from 2X4s and the other from 2X3s. The 2X3 version is a whole lot lighter but still plenty strong, and I recommend that approach. I've taken down the 2X3 version because a nearby tree (a giant sequoia) grew to antenna-support size. The 2X4 one is still up after about 15-20 years. Both are about 40 feet tall, and were made from 22-24 foot pieces of lumber. Don't know if you can still get them this long. This construction obviously wouldn't be portable, but might give you some ideas.

Now now. You're starting in with practicalities! This is an obsession, the notion of metal traces bonded directly to the glass -- it's not subject to practical considerations! :-)

But seriously, I've done a little bit of point-to-point (in kits, like my HW-101, and from scratch, a couple of
HF VFOs built dead bug style as experiments) wiring, and what you suggest is very interesting: perhaps point-to-point using standoffs mounted to the glass. Someone recently suggested an interesting method of boring holes in plate glass -- chucking a suitably sized piece of copper pipe into a drill, and using it with abrasive-filled silicone compound to grind through the glass. Apparently one can use Indium compounds to join glass to metal or glass to glass... Also interesting.

Anyone know how toxic Indium is?

thanks, good food for thought,

> . . .

I've had some experience with both silver paint and conductive epoxy. The silver paint was used to do temporary repairs and experimental connections on hybrid circuits. It's very conductive but not strong at all, so it won't take any mechanical stress. I've never tried soldering to it, but doubt that you do so reliably.

We used conductive epoxy a great deal for attaching components to hybrid circuit substrates. The epoxy was a single-part, heat-curing variety. It's hard when it dries, and sticks well (but everything has to be *very* clean). This may be viable for your application. I'd be careful in mixing this process with soldering. If you do, you should do the epoxy attach first. It'd be really difficult to get things clean enough to epoxy after soldering in the same vicinity.

I've had trouble (actually, long days, nights, and weekends of hair-pulling trouble) using conductive epoxy for attaching small beam-lead diode bridges (connections develop a few tens of ohms of resistance), but don't think you'd have trouble with larger components.

The longest I have been able to find at the average lumber yards is 20ft.
I use 2x4s up to 30ft and then a fiberglas pole for the last 20ft.

It may have been invented years ago, it may have been used on circuit boards for bomb fuses, but it is far from being an obsolete process. There are many manufacturers using silk screening for conductive traces on ceramic and glass substrates, for among other things, strain gauges. We did a project a couple of years ago that used a conductive platinum/glass compound that was fused in a furnace to a ceramic substrate. The application for the device was in extremely high temperature environments.

The temperatures used in soldering to the screened traces by the way are as high or higher than those used on standard boards. This is primarily due to the properties of the trace materials and the types of solder pastes used. Most of the trace materials I have worked with are platinum and alloyed platinum/gold. While standard soldering methods work they don't withstand the high temperature applications we were dealing with.

As far as a do it yourself at home project I wouldn't know where to start. I would prefer the vacuum sputtering method with an electroplated copper build up to strengthen the traces. This would allow you to use conventional print and etch techniques. Surface preparation for whatever method is used can be aided by glass bead blasting the surface prior to application of the

material of choice. It adds a micro pitting on glass surfaces that is hard to accomplish with other methods, including chemical, and the added adhesion properties are well worth the effort.

> (e.g., 7.5, 36 and 90 pf). Should I just use the next higher value that
> is available? Or perhaps the next lower?

Depends on the function in the circuit. If they're used in a resonant
circuit, you'll change the tuning of the
circuit if you change the value of the cap. If they're used for coupling,
changing the value a little bit may or may not be bad, depending on the
design. If they're used for bypassing, the values can be broadly substituted.
Many people here know more about this than me, and will hopefully chime in.

In any case, these sorts of caps are unlikely to have failed and you should
definitely not replace them unless you've got a specific reason to do so.

> Many of the caps listed are mica. I understand that mica provides
> a greater temperature stability, but they are pricier than I like. One
> source I have says that ceramics rated NP0 will work well for temperature
> stability. Is that true? What are the circumstances in which you would
> definitely want to use mica, instead of ceramic?

NP0 is a type of ceramic material that exhibits a very tiny amount of drift
with temperature. They are in general superior to silver micas in resonant
circuits. Silver micas supposedly aren't good under large DC biases -- the
silver migrates through the dielectric, or so I've read. Again, see comments
above about not touching unless blah blah blah...

> What about mylar? Polypropelene? Tantalum? What applications
> would these be best suited for?

buy a copy of _The Art of Electronics_ by Horowitz and Hill. They discuss
capacitor types at length. An excellent and readable book. The accompanying
lab manual is excellent, too. amazon has both of these.

I think Barnes and Noble had a sale on _Art_ recently.

Also, Terman's _Radio and Electronic Engineering_ (you can find copies at www.mxbf.com) is very good
and covers material in a way more modern texts do not. 4th edition preferable.

> What is the meaning of the various temperature coefficient ratings
> (NP0, Z5U, etc.)
>
> The same question regarding EIA Class I, II, and III?

can't answer these; you can probably find via a dedicated enough web search. try www.dejanews.com to search back through newsgroup postings.

> Trimmer caps - are these just adjustable capacitors?

yes -> trimmer implies a variable that's intended to be set once and left; usually physically small, and having a
fairly limited range and small capacitance, as general guidelines.

> Snubbers?

I think these are RC networks packaged as a single unit, intended to absorb energy created by opening the circuit through a large inductive load. But I could be wrong.

> In power supply applications, I have seen some schematics that use
> monster electrolytic filter caps - 20K mf. The radios I am working on
> use 20 mf. What is the purpose of using such huge ratings? Is it just a
> better filter?

I think so, but there may be more to it than that; perhaps larger caps store more energy -> can deal better with
smoothing out ripple when large current flows are involved. Are these schematics for high-current DC supplies for solid state amps or transceivers?

> I would very much appreciate any responses that would help me to
> understand the nature of these beasties a bit better.

OK, here's some general advice:

You aren't planning on replacing all the caps in these things, are you? I think that that would be a bad idea.
Only the electrolytics are at all likely to fail, and in my experience not all that likely (I have some very old tube radios still running on original electrolytics).

You should try to diagnose any problems and resolve them as surgically as possible.

One thing that *can* happen to old electrolytics is depolarization, which can lead to failure when power is later applied. Depolarization happens when the set's been sitting unused for a long period of time. You can avoid this by re-forming the dielectric -- get a variac, a variable autotransformer (see

www.surplussales.com or preferably (much more cheaply) your local hamfest) that allows you to control the voltage applied to a device. Start off with the variac set to some very low voltage, say less than 10 VAC, and slowly advance it, allowing the device to sit for some significant period of time at each new voltage, up to 110V. How long? I've heard people say 20 minutes; others say at least an hour. I've no idea what the "correct" amount of time is; hopefully here someone with more hands on experience will chime in... but slow and steady is better than plugging the thing into the wall and turning it on.

Particularly, the notion of replacing silver micas and suchlike, which you seem to be hinting at, is asking for trouble. These are very reliable components and you should only replace one if you've got good evidence it's failed. Throwing the tuning off on the interstage coupling xformers in a superhet receiver, for instance, will lead to a bunch of work that ain't easy to do even with the right equipment unless you're experienced.

This beautiful vintage wire is composed of two 22 guage conductors, one with white colored insulation and one with orange, intertwined within a paper sheath, residing inside a very heavily woven shield, in turn surrounded by another paper sheath, and this is then covered by a very durable and flexible yet thickly woven cotton covering of a light grey-pink color. This wire is of the utmost in quality, and perfect for stringent instrumentation or tube audio requirements. I'm not sure how many feet are on the spool, but as you can see, it is full. 200 feet maybe? Don't hold me to that, it's just a guess. The spool itself is extremely nice on the top, but does have some slight scuffing and a little surface oxidation on the bottom, as shown in the pictures. I have not seen a nicer 45 year old spool of wire anywhere.

> TIA - Dan

DO NOT USE IT !!
Instaed use a noise bridge.
The GDM is an oscilator that is adjusted with the dial to a certain frequency
And it runs prety stable on the selected frequency. when coupled to a resonant tank
the load kills the oscilation, the grid curent went up (the old days of tubes) and the user took a measurement.
Before the oscilation died because of the heavy coupling, the oscilator changed frequency, some times A LOT!
Therefor the grequency it was set and the frequency it died, to give an indication can be from wide, to
very wide.
A noise bridge on the other hand, generates a wide band noise, you tune a receiver to the dsired frequency, and
adjust the tank until the noise goes down on that frequency. this way you KNOW what frequency you are working.

The old proximity fuses were built with vacuum tubes too. They were
rugged enough to survive being used in mortar shells.

I have at least 20 ea. 22 volt 2.4 amp transformers in plastic case, with jack for computer type ac cord (120V 60Hz input). About 4" cubed, 3.5 lbs. each, unused mint condition, $3.75 each or 4/$14 or 10/$30 plus UPS. 36330 zip.(Alabama) Can be used with a rectifier and appropriate sized cap to power 28 V filaments, or as is for 21 V or 24 V sweep tube filaments. Also good for 24 V power supply. NOTE: Please REPLACE the "40" with "snow" to make "snowhill" or call 334-347-5281 day/eve/wknd.

If I recall correctly, the RS DX-390 is built by Sangean. They use a couple of JFETs in the front end as preamps, and they are very sensitive to static discharge. I worked for a time in a Ham / SWL repair shop, and that was probably the most common repair for many of the Sangean portables, the Sony ICF-2010, and the occasional RS portable SW that came in. We had a "calibrated" AM broadcast station in town that we used for testing the Sony - if it read S9 or better, the FETs were OK. If it read S4-5, one FET was blown. If it read S2 or less (or was inaudible) most likely both FETs were shot.

While we tried to use original manufacturer's parts for repair, we found that the venerable MPF102 was a suitable replacement. It seems to me, though, that the FET pin arrangement was different, requiring leads to be swapped around a bit. I think - I may be mistaken.

Still, the Sangeans were generally decent SW radios for the money.

Roy,

Something I've considered, but not yet tried, is laying down a pattern of conductive ink (paint, epoxy, whatever) and then plating copper over the top of it. Copper plating isn't especially difficult, and can be done with chemicals available from a drug store (copper sulfate). (It's not like gold plating, which uses cyanide compounds.) I used to copper-plate Mom's silverware when I was a kid. Boy was she mad! (Grin) Still, it's not bad.

It would take a while to plate up thick enough copper to solder to, but it might work well enough to mount small parts with a low-wattage iron and low temp. solder.

Yabbut...

That takes a LONG time. A friend of mine used to make rings from tiger eye (a silicate mineral, if I'm not mistaken) the same way - two pieces of brass tubing for the inner and outer diameters of the ring, a slab of mineral, and an abrasive slurry. Took about 12 hours by his report. He'd mount the rock on the table of a drill press, mount one of the tubes in the drill chuck, sprinkle grit on the rock, and lower the drill running at slow speed. He got tired of holding it so he'd use a bungee cord to keep the drill bearing down, then go away and watch TV for a few hours.

Of course, we ARE talking about obsessions here...

1778. Wondering if solder will wet etched glass?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-12 00:00:00 UTC
From: wlfuqu00@pop.UKy.EDU
Message-ID: <199902121351.IAA01530@pop.uky.edu>
Source record: 73503

You could try to plate it with copper first.
But to do that you would need to coat it with
something conductive such as DAG (a graphite suspension).
It is commonly used in CRT's and such. Then connect a
power supply (negative terminal) to the DAG and positive
terminal to a copper anode both placed in a water and copper sulfate
solution. Copper sulfate is a common salt that I used to
get at local drug store. Once it is plated in copper solder
could stick to it. In fact DAG will stick to un-etched glass
as well. I don't know how strong the bond would be but it
should work.
Years ago my father had an imported car that had bad
starter brushes. Parts for this car were not available in
the US. I got some brushes that were much larger and ground
them down to size. Then drilled holes in them and plated the
brushes with copper using copper sulfate solution. After that I
put the big stranded wires into the holes and soldered them.
Worked well. Had no problems with them after that.
It just happened that the week before that we covered plating
and electrolysis in my high school chemistry class. Timing was
perfect.
Oh, by the way, don't put the copper sulfate solution in
a metal container. It will most likely eat a hole thru it.
Also be sure to read all the MSDS information and warnings.

Please disregard everything posted above. The poster soes not know
what he is talking about.

A GDO, when used properly, DOES NOT quit oscillating when coupled to
the circuit under test (CUT). If it was not oscillating, where would
be the "grid dip" indication?

Proper use includes loose coupling, not "heavy coupling." Bring the
GDO inductor near the CUT and slowly tune the frequency dial until the
dip is noted. Once the dip is found, reduce the coupling by
increasing the separation between circuits and re-null the meter. If
you need to know the frequency to better accuracy than the dial
provides, leave things positioned as they are and tune your receiver
to the GDO frequency and read the receiver dial.

Most of the resonance measureing schemes using noise bridges load the
CUT so bably that the frequency accuracy is worse than the
GDO/receiver method.

At work I have at my disposal a half-million dollars worth of vector network analyzers, impedance bridges, vector impedance meters, etc. I still keep a GDO around the lab, but I don't have any noise bridges.

At home for resonance/impedance measurements, I have several sig generators, two Boonton Q meters, two Boonton RX meters, an HP vector voltmeter, two Millen GDOs and a prized RF Measurements Corp GDO, but no noise bridges either.

Use the GDO!

If you can find the July/Aug 1998 QEX, I had an article in there that shows a Stamp-based keyer. The nice part is you can program it in situ and it is easy to program in Basic with no extra hardware. The firmware I supplied did iambic with dot and dash memories, a "canned" message and sidetone.

You can find more about the Stamp and the new Basic Stamp FAQ:
http://www.al-williams.com/wd5gnr/stampfaq.htm

You can also find a lot of ham, Stamp, and PIC info at
http://www.al-williams.com/wd5gnr

The keyer will also be a project in my upcoming Stamp book.

DuPont makes a line of conductive inks/pastes designed to be
screened onto a substrate and then fired in an oven until they melt
and fuse to the surface of the substrate.

I've used them on alumina and they worked very well, but I'm not
sure how they'd work on glass.

Check with DuPont.

Alternatively, there are conductive epoxies which you could use
which would make your life considerably easier; paint the traces,
stick on the components, let the whole thing cure, and there you go!

Master Bond comes to mind as a supplier of conductive epoxies, and
they have nickel based as well as silver based ones.

You better be sitting down when you find out how much they cost!

Enter the wonderful world of lasers. Boring holes is both easy and fast
if you have enough power and the right type.

When I was a kid I made a 5" reflector telecscope. I grinded my own mirror out
of thick glass. While grinding process was exceedingly boring and took a long
time, but cutting of the glass (about 3/4" thick) was fairly easy. I was using
a piece of steel tubing of 5" in diameter, attached to a wooden handle across
it so I coud rotate it on a glass and abrasive paste. Took me few hours to cut
through without any electric drills. It was an easiest part of whole project.

Hi Bill OM,

Even though it appears you are averse to spelling and punctuation, it would
be helpful if you could describe your needs more accurately. What does
"mw bands" mean. Do you mean "Microwave Bands"? If so, it should
be obvious that you cannot extend the basic design of an HF transceiver like
the TS830S and convert it into a microwave transceiver. You could
build a transverter to reach microwave bands. However, this is a major
project, best built in modules, and is not a beginner's project. If you want
to tackle it, I suggest reviewing the many articles in the literature over the
years describing transverters and converters from HF to UHF and higher
bands.

Want to build my own nicad power pack for my NorCal 40A. I have some 12VDC wall cubes laying around to use with it. What I would like to do is make sure I have nicads charged up for whenever I want to operate portable. The battery holder I am using can take either AA nicads or AA alkalines. Are there some construction projects some where out there on the internet that I can take a look at? Sources? Past experiences of others here? Thanks for any and all help!

Yes, that would be obvious to anyone that knows anything. What I meant
was the medium wave band, the AM band, below 1650. Currently the low end
of the recieve is about 1400 kilocycles. I would like to know if there
is a way to extend the recieve freq of the vfo230 to below this value.
No one grades the newsgroups on punctuation.

There was an article in the January 54 issue of Wireless World
describing exactly this approach. You have to "form" point contact
transistors with a high voltage pulse before they will function and the
circuit arrangment required is radically different from that needed for
junction transistors.

I can email you a copy of the article if you wish.

cheers

Kevin White

Or You'll just have to "ORDER" the parts from their warehouse... It's called "RSU" Or Radio Shack Unlimited... Unlimited is correct... the prices are HIGH! Also TECH America is a catalog Tandy puts out with similar part numbers... If you see one you'll know what I mean.
I worked for the "Corporation" for just about 2 years... If the pay was higher... I'd consider going back... I felt I was one of the few guys that would help customers... To this day I speak to some of my "shackie" friends and one manager has told me some of my customers still ask for me... this was 3 years ago!!

Johnson wrote in message ...
+AD4-Trying to find info for substitution or a source for transistor CP640.
+AD4-Appears to be a JFET in a TO-5 case. Logo on case looks like +ACI-C+ACI-. About
1980
+AD4-vintage. Would appreciate any help.

If I remember correctly, it was made by Teledyne Cyrstalonics. It think it
dated more like 1985 or so.
It is a high current device and was used as +ACI-bullet-proof+ACI- wideband
receiver RF amplifiers.

I know of no sources for anything similar today. One possibility would be
to parallel several conventional JFETs.

I have a data sheet somewhere but it might take months to find it+ACE- :-)

OK so something is changing;
0.) Did you have this problem with 120VAC input? If not you might have something wrong with your transformer or PSU
1.) What is your SWR into your amp? Is your rig shutting down as the input circuits warm up? as the tubes get to their real operating temp?
If yes use a separate tuner between the '570 and amp and see what happens or retune your '570 after "warmup". . . however, the auto tuner may not be able to do the job after the tubes get hot. . .
2.) Does your PSU voltage sag under load more when your power is "drooping" (see 0)
3.) Is your dummy load overheating and presenting a different load to your amp? (get a bigger d/l)
4.) What color are the plates of your tubes while your power is "drooping". Does your Ip also sag?
The tubes could be doing their thing correctly and you have a series component from the PSU to the anode that is changing value under load. OR if your tubes are redding up nicely and your power out is decreasing look at your output network for components (probably a cap) that are flaky under load. (unfortunately, this is a replace and try function)
5.) Can you smell anything from the amp while you are operating at full power? If yes what does it smell like? Acrid? Sweet? Like paper burning? Like tar?
Lemme know. . .

Having a roomful of equipment and knowing what they do should go together, in
my lifetime I have seen a lot, including arogant people who (know better).
It does not bother me a bit, from what you say, it is not me that is
rediculed, so why wory? Only one thing, while cuting coils for a ten meter
amplifier, and if you do it with your trusty GDO turn your reveiver on and
mark down the drift, of the GDO, from very light coupling to enough coupling
to know you are coupling to the coil under test. When you do the same on two
meters where even the chassis its' self can be resonated, well! i guess a few
kilohzrtz like perhaps 10 is of no impotrance, specialy if you have a roomful
of equipment

Throw the GDO, better yet sell the darn think in the next fleamarket.

Hi all I am in the process of designing a vco type vhf
oscillator based on a N ch J fet. ... It is very similar to a
common clapp type oscillator.... 60 - 75 mhz

Normally one would couple the rf from the source of the jfet to
the next stage buffer via a coupling cap of a few pico farads.

My question is has anyone had any success in using a 4 to 1
transformer for this conected in series with the drain of the
fet and the power supply...Thus the secondry of the transformer
would feed the next stage through inductive coupling thus providing
better isolation for the oscillator...

Also how would one go about calculating the correct type of
transformer for this application. I had in mind using some micrometals
broadband bauin cores...

Its kind of an odd ball question but hopefully some of you might
be able to provide some help...

Thanks Jd....

If memory serves they are F/59, F/56, and F/56QS.

F/59 is designed for RG/59 coax, F/56 for RG/6, and F/56QS for RG/6QS (Quad Shield).

I haven't seen such a Web page but if you pick up a package at a local RadioShack there is a fairly decent instruction set on the back of the blister pack.

I assume it's on 60-75MHz, not mhz. Sure, transformers work fine for coupling. As for better isolation, you my wish to consider running the drain into a common-base stage to really get better isolation. Otherwise, you'll find that changing the drain load will surely change the oscillator frequency anyway. Then it's a matter of design: what load do you want to present to the collector of that common base amplifier (or to the drain of the jfet)? You can use whatever turns ratio you want (well, over some range anyway) to transform impedances. It doesn't have to be 4:1. Seems to me there is an example of transformer coupling out of an LC oscillator in the ARRL "Solid State Design" book, in the 2-transistor 10MHz oscillator.

Teledyne Crystalonics refuses to sell in quantities under 5000pcs. Been attempting to buy small lots from them on and off since 1988. Teledyne sell these parts to OEMs ****only***, not to consumers, as I was told in 1993 by Teledyne.

U310 or the (obsolete?) P8000 are the most likely substitutes.

Good luck.

My older Kenwood is a very different model, but has the "auxilliary" band
switch position, too. I would recommend using that for the mw band coverage.

Jeff,

I'll let somebody else point to the project sites. I have used packs for AA cells in various projects. The idea works great but you must keep in mind that alkaline cells have about 1.5 volts per cell and ni-cads provide about 1.2 volts. Stacking them in series to achieve higher voltages emphasizes this difference.

Six alkalines will give you 9 volts, but if you substitute ni-cads you will only have 7.2 volts available. Eight alkalines give you 12 volts... ni-cads 9.6 volts. This is not a problem if the circuits will work at the lower voltage and you will be satisfied with reduced power.

Engineering from the other direction.... ten ni-cads will give you 12 volts. Put alkalines in the same pack and 15 volts are applied to your rig. Still not a problem if the rig can take it.

Assuming something like a "12 volt rig" consider using a nine cell pack. Ni-cads provide 10.8 volts and alkalines give 13.5... inside the range usually specified. Some commercially available equipment is supplied with dummy AA cells to reduce the voltage when using alkalines just because of this.

I build the pack for a cell count that will give acceptable results with either cell type. Commercial equipment may be designed to run from the "12 volt" automobile system. These thrive on 14 or 15 volts... so design for that.

All you need now is the info about how to care for and feed your new battery packs :)

Do like someone else suggested, and use the calculation for a half-wave dipole ...Divide 468 by the frequency you work the most, make the antenna using 12-14 guage wire, someone suggested hooking the soldering the coax to each leg, here is what I do, I get a cap(plastic) from a 20 ounce coke bottle, I drill three holes in it, one the size of the coax at the bottom, and one on each side 90 degrees from the big hole, feed each leg into the smaller holes, and make a small loop in the end that is inside the cap, feed the coax in the one larger hole, solder the center to one leg, the sheild to the other, pull the legs till they are tight, then either fill the cap with wax and tape it up or mix up some(J-B Weld) epoxy cement, and fill the cap up, let it harden, this makes it resistant to water and stress, solder some crimp on lugs on each end of each leg. This gives you something to tie off too.You might mark one leg as the center conductor if you choose to run it vertical, the center goes up.
I use a vertical dipole similar to this in design with 50 ohm cox with no problem. If you want, what I suggest is making the legs a bit longer, then gradually cutting them down till your SWR is flat. I have had great luck with this type of antenna, and it is entirely possible to get a flat SWR, the key to it is the spacing between the legs(where the coax attaches, the cap is just about perfect distance and the angle relative of the coax relative to the legs, experiment with it, the 50 ohm would be at a 90 degree angle from the legs). I use electrical conduit or copper water pipe instead of wire, handles alot of power, and RF likes "the skin effect" and it likes copper(coax solders to it easily). I read somewhere that the bigger diameter of the conduit/pipe made the antenna more broadbanded, but I am not so sure of that. Anyone have a guess??

In article <36a3e082.3029132@news.io.com>, maddog@io.com says...
> Could the AC line be used as an endfed receiving antenna? Given that
> most houses have 50-100 ft of wiring between the house and pole
> transformer, does this imply that the performance would be similar?
> How would one best (and most safely) couple to it?

Yes. I did it for years. It's stupid and dangerous but it does work. The antenna is very simple

Take a piece of zipcord about 20 feet plus some. Use cord that you can ***CLEARLY*** make out which wire is which. I used the kind with the transparent cover and one copper wire one silver wire (maybe it was speaker cable. I dunno. It was in the junk box)

Strip off 10 feet of silver wire from one end and 10 feet of copper from the other end. It should look like this (not to scale):

```
-------------------------
-------------------------
10 feet 20 feet 10 feet
```

Put an electrical plug on one end and the antenna connector of your choice on the other end. Tape the ends of that middle section WELL.

Let's recap here. You have a single wire going to a single electrical blade on a plug and ONLY THAT. You also have a single wire connected to your radio. These wires are not connected to each other in any way whatsoever except for the insulation between them. There is no electrical contact between the wires. The ONLY contact between them is the insulated middle part. Tape the cut ends on that 20 foot section ***WELL*** and check it with your ohm-meter a bunch of times to make SURE there is NO electrical contact between the far ends of this thing.

There you go. I found the blade works best in the hot side of the outlet most of the time but sometimes putting it on the other side is actually better. I don't know why.

You can wrap that middle section in tinfoil to improve the capacitive connection a bit. It works great. It's better than my attic-wire.
(RECEIVE ONLY. DO NOT TRANSMIT WITH THIS!)

DISCLAIMER: THIS IS A REALLY MENTAL IDEA! DON'T DO IT!
IF YOU SCREW UP YOU WILL RUN 120 VOLTS INTO YOUR RADIO AND MAYBE KILL YOURSELF!

Sorry for all the yelling but I want to be clear about those points. :)

>case. Is there a specific rule of thumb or a more precise way to
>calculate this...

If you put a load directly on the oscillator transistor, try to make it as unvarying as you reasonably can. The idea of the common base stage as a drain load for the jfet is that the load it presents to the jfet is pretty constant, even though you may change the loading on the output from the collector of the common base stage. As for what a reasonable load for the common base stage would be, you'd generally not want it to saturate or come close to saturation. Then the load depends on the voltages and currents involved. For example, if you hold the base at +8 volts (the emitter then being at about 7.3 volts or so, and therefore the drain of the jfet is also at 7.3 volts, being directly connected to the emitter) and you have an overall +20 volt supply, and if the peak jfet current is 5mA, then you might reasonably put a 1500 ohm load in the collector of the common base stage. That would result in a minimum collector voltage of about 12.5 volts (20 volt supply, minus 1500 ohms times 5mA), for about 5 volts minimum drop across the output transistor, keeping it well out of saturation. But if your peak jfet current is 20mA, then you'd want to use a much lower load impedance to avoid saturation. Similarly, if you run on lower voltages, you'd want lower load impedances. In other words, there's no single correct answer. And the voltages and currents you choose (along with the load impedance) determine the power you'll get out. What you need depends on what you are trying to accomplish.

In article <79e7ma$7pr$1@msunews.cl.msu.edu>, kh34@hotmail.com says...
> Would you go with either of the Shack antennas for this model, or would you

No way. You can MAKE a shortwave antenna for next to nothing.

1) Get as much wire as you can.
2) Mount it as high as you can.
3) Have fun.

Really. That's all. Run it around the room. Run it across the yard. Throw it in a tree. Drop it out the attic window.

As for the radio end, if you have an external antenna connector on the radio then find a plug that fits and solder the antenna wire onto it. If you don't, then use an alligator clip and clip it onto the built-in antenna.

About active antennas, sometimes they help, sometimes they hurt. They will amplify the noise as well as the signal and sometimes put too much signal into the front end of your radio. If you really want one you can MAKE one for about $0-10 depending on where you get your parts (new or from a junkbox).

Try http://www.ee.washington.edu/eeca/circuits/activeant.html

This one looks just like a device called the "TinyTenna" that some guy on the web is selling for $20. Some people like it, some hate it. I don't know the TT website URL. I don't know from Tinytennas, but I won't pay $20 (plus $5 shipping) for something I can make myself for FREE or close to it anyway. The only thing a guy might not have would be the MPF102 transistor.

I've seen this curcuit in magazines too. It's actually an impedence matcher. That makes sense. A random-wire antenna has a very high impendence. Your radio has a very low impedence (50 Ohms). If you can match them you'll get more signal power into the radio.

Also check out the rec.radio.shortwave newsgroup. Just don't say "tinytenna". Some jerk has been spamming us with hundreds of testimonials and other crap.

Yup, that's right... it is make by sangean. I was just at the Rat Shack this morning and the dx-390 has the cassette so mine was a dx-380. not sure what sangean's model number is for that rx. Yeah, other than the front end being way too delicate for anything but sitting on a shelf in the box it came in, it was a decent receiver. But you know there must have been thousands brought back to the store with blown front ends... yet they still sel the damn things. So why not fix the design, instead of fixing the radios one by one?

Hello, do anyone have a variable vacuum capacitor 200v 1000pf aprox.
for sale?? the last part to complete my homebrew HF amp.
tnx in advance de Frode LA9WDA

1825. Design of a frequency counter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-14 00:00:00 UTC
From: hkelle@rhi.hi.is
Message-ID: <7a6hvt$qkc@eldborg.rhi.hi.is>
Source record: 73650

Hi

I'm in the process of designing/building a DC receiver for 14Mhz.
I'd like to add to it a display that shows the frequency of the
local oscillator. I was wondering how to design a frequency
counter for that purpose. My ideas so far are:
Use the signal from the LO to drive a binary counter for
a given period of time (f.x. 1 sec), when the time has elapsed, convert
the state of the counter to BCD digits and show on a display.
The counter and all other logic would be built using standard
TTL components or programmed on a PAL chip.

Any comments or references (web pages) to a similar design?

TIA
Hrafnkell

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.amateur

I have an RCA Series 700 UHF repeater. I
am looking for a a service, shop manual for it.
I need information for tuning up the RX/TX sections
and basic controller wiring (RX/TX audio, PTT and
REC COR) tap off points, for my external (CAT 300)
controller.

If you have such a manual for sale, or could copy
the appropriate sections and mail or fax them to me, I
would gladly pay for these services.

Thanks;
A-American Inc.

Source record: 73652

Hello,

It's a bit late to redesign something after it's out the factory door.
Why they still sell what thet still have I don't know. Perhaps the
right RS personell in position of power do do something isn't aware of
the problem, even then the choices are limited what they can do with
remaining inventory, to strike a balance between customer satisfaction
and company profit.

> the cable?

these are "F" connectors. there exists a large variety, the most common you will find is a one piece design that you would need the correct size of "hex" crimpers to attach the connector to the cable (matching the correct connector size to the specific cable, i.e. rg-59,rg-6, single braid, double braid, single foil, double foil, etc.) usually available at a local source would be a "screw-on" type that needs no special tool other than a knife and fingers to attach. try radio shack, walmart etc. if the cable company put the connectors on themselves, most of them have started using a two piece compression fitting that minimizes rf leakage (if properly installed) these require a tool specific for the brand of connector... so even if you could talk your local catv tech into a handfull of them, without the tool it is almost impossible to attach them. if you have several to attach to coax, radio shack has a prep tool for about $10, and a hex crimper for about $15 that will work with their coax, or most single braid, single foil rg-59 or rg-6. i believe the instruction are on the back of the package for the prep tool. sorry if this is 'too much info' on your question.

I think it's wishful thinking to expect to get to 10GHz with lumped
constant devices.

I've seen simple circuits go from 10MHz to a couple hundred MHz. But
whatever you use, it will have to have some ALC.

This is dangerous, do not do it. A capacitor would have at least
a 3kv rating to be used safely on AC lines, and would be under
.01 mfd to limit AC currents.

Jim

The coax is not 50 ohm, it is closer to 900 ohms.
The coax run is kept extremely short to minimize losses.
The receiver is not 50 ohms, and is matched to the antenna.

Wringing every last bit out of the signal would imply
a fairly lossless design. Most good designs allow
for variable coupling between the tuned stages to
permit trading off some signal for improved selectivity.
I have driven vintage 2k horn speakers with some sets,
using a good longwire and good ground. Don't expect
to rattle the windows, however.

Yes, you can build a FM xtal set. AM sets work well because
crystal sets are designed to demodulate AM signals. Most
FM designs depend on a high Q circuit so the set works on a
slope detection principle. 150kHz deviation at 90 MHz is operating
over a very small portion of the tuning slope of a simple LC circuit,
hence little audio recovery. If you are line of site to a strong FM
transmitter, it will work.

I think you are in trouble. :-)

The ONLY way you are going to get that kind of coverage in a practical, homebuilt design is to use a YIG and broadband mixer. You will need to use harmonic mixing and filtering on a (for example) 2 - 4 GHz YIG. Your only hope is to buy a crateload of scrapped spectrum analyzers and other assorted microwave junk and scavenge the parts. (BTW it is hard to imagine anything simpler than a YIG oscillator, and they are dirt cheap on the surplus market as well.)

You will want to examine your assumptions behind the need for this project, in general. I am not sure you can buy a commercial network analyzer (aka a "super grid-dip meter") that covers that range in one monolithic block, at least not for less than the price of a brand-new Porsche.

Jim (jpennell+AEA-ix.netcom.com) wrote in message
+ADw-7a7je3+ACQ-8ds+AEA-sjx-ixn5.ix.netcom.com+AD4-...
+AD4- Does anyone know what the typical impedance the radio is designed for
in
+AD4-AM and FM operation ?
+AD4-
+AD4- I'd guess the FM is around 50 ohms, the whip looks like 1/4 wave.
+AD4-
+AD4- The AM, on the other hand, is a physically SHORT antenna segment, which
+AD4-ought to make it a high impedance but they run it through the same coax.
+AD4-
+AD4- Do they use a low impedance at the radio, and eccept a major mismatch ?
+AD4-
+AD4- Or, is the AM in the radio a high impedance input, and they ignore the
+AD4-losses caused by the low impednace coax ?
+AD4-
+AD4- It's true that, due to the general noise level at 1 MHz, a relatively
+AD4-non-sensitive system might be an advantage. I can live with whatever
it
+AD4-is, but it would help my design to know what I'm starting with.

I would have normally ignored posting to this person because of his own use of forged headers, but his questions are specific unlike the open-ended +ACI-what is the best radio+ACI- usually seen...

The impedance seen on FM is much like you anticipated. A one meter monopole antenna at 100 MHz will present an impedance of about 148 ohms in series with about 212 ohms of inductive reactance. This will be transformed by the section of coax from the antenna to the radio.

At 530 kHz, the low end of the band, a one meter vertical antenna working against the grounded car body will have an impedance of slightly over a milliohm in series with a capacitive reactance of almost 26000 ohms (almost 12 pF). At 1700 kHz, the high end of the band, the same antenna will present an impedance of approximately 12 milliohms in series with a capacitive reactance of approximately 8200 ohms (almost 12.5 pF). You can alternately view these as a parallel combination of a high resistance in parallel with a capacitance. At these low frequencies, the coax adds additional capacitance as any reasonable length is such a small fraction of a wavelength.

Normally an automobile AM receiver is designed for high impedance input. You are correct that normal background noise at these frequencies totally swamps out weak signals. Thus true impedance matching is rarely necessary.

says...
> I have driven vintage 2k horn speakers with some [crystal] sets,
> using a good longwire and good ground. Don't expect
> to rattle the windows, however.

Of course not :) I would just like to be able to hear it in a reasonably quiet room. My plan was to mount the radio as part of the bedroom furniture. Perhaps on a high shelf up in the corner. Sort of a permanent background thing. If I fry the "front end" during a lightning storm I won't cry about it. <grin>

Oh no! My 20 cent diode blew out!

As long as it's hearable at night when I go to sleep that'd be fine.

>
> Yes, you can build a FM xtal set. AM sets work well because

Interesting. I thought FM radios needed a "product detector" or whatever it's called. I see. am FM xtal set will work OK in theory, but so-so in real life.

Thanks

>Doug N0WVA

I would try taking a silicon solar cell, and spot-welding (via
capacitve discharge) wires of appropriate material to it.

IIRC solar cells are highly doped, so they may not be usefull. I think
uni-junction transistors (strange transistors designed for relaxation
oscillators) are made by spot-welding aluminum wires to the substrate,
the spot welding causes diffusion and thus dopes the NPN/PNP sandwich
structure.

Power transistors have large die's, but are well protected by thick
oxide coatings. And that would be cheating, wouldn't it?

I've wanted to experiment with tunnel junctions, made by adjusting a
sub-angstrom length gap piezo-electricaly. They have semiconductor
properties and may function as tera-hertz range negative resistance
junctions.

|Scott Stephens, KB9ETU

About the best you can do with a hyper-abrupt varicap is a 2:1 tuning
range. More than that will require some kind of range switching. To
10GHz is somewhat optimistic...that frequency will require a stripline
or ceramic resonator.

The "coax" that they use between the antenna and the radio is very high
impedance, with a very thin center conductor. The antenna behaves as
a high impedance voltage probe.

Hi,
100 to 250 Pf will do.
H.V. mica type cap. is prefered.
For added safety, you can install a fuse in series.
And keep it out of the way.
Same thing can be tried on the telephone line.
My neighborhood has all the utilities including cable TV underground,
so can't do this trick.
Tony

> This is not a problem if the circuits will work at the lower voltage and you will
> be satisfied with reduced power.
> . . .

Various arguments can be made that alkaline cells are better for some applications than NiCds, but this isn't a valid one. The reason is that the voltage of an alkaline cell drops a great deal more than a NiCd's over the discharge cycle. A NiCd will maintain a cell voltage of 1.2 - 1.25 volts during almost the entire discharge period, even at heavy current levels. But take a look at some measurements I made of a typical AA alkaline cell discharged at 250 mA.

At the end of one hour, the cell voltage was 1.26V.
At 2-1/2 hours, the cell voltage was 1.15 volts.
It reached 1.0 volts at about 4-1/2 hours.
It was 0.9 volts after 5-3/4 hours.
(The drop from there to 0.8 volts was rapid.)

This illustrates why the battery manufacturers state that alkaline-battery powered equipment must be designed to work at voltages down to 0.9 volt/cell in order to extract most of the energy from the battery. If your equipment requires 1.2 volts/cell or more to operate, you'd have to discard an alkaline cell after it had delivered only 1/3 or less of its energy. If you're depending on 1.5 volts, you'll only be able to use a new cell for a few minutes before replacing it.

The voltages will differ some from the ones I reported, depending on the current drain. At currents higher than 250 mA, the voltages will be lower, and at lower currents, higher. And cells will vary with manufaturer and lot. But at any current drain, you'll have to allow the alkaline cell voltage to drop below 1 volt/cell to extract most of its energy, while a NiCd is just about totally exhausted when it drops much below 1.2 volts.

>
>How can one get microfiche images (each 6mm x 9mm, 180 per film) into
>digital form? Printing the pages (via microfiche printer) and then
>scanning the printouts was suggested. Any possibility of direct scanning?

I know that you can get scanners designed to directly scan 35mm
photographic slides or negatives. Perhaps such a scanner could be
used with or modified for microfiche. Check with people like Nikon,
Xerox, and Kodak - this has probably come up before.

If these have been reduced from a "standard" sheet of paper, about
216x279 mm, then it's about a 35x reduction. Some flatbed scanners
can be set to scan transparencies, and can get hardware resolutions
of 1200 dpi or more. This only translates into about a 35 dpi
resolution for each frame on the microfilm, but if the information is
not too detailed, might be marginally useful. Higher hardware
resolutions will get better results. Some scanners use software
interpolation, but for this application, you probably want the
resolution in hardware.

Good luck!

We published a couple of articles in E+WW usimg the sequencing network
described. It was otherwise known as the polyphase network. Its advantages
are
- almost limitless suppression/quadrature accuracy depending on how close/
how many poles you have.
- bandwidth is also determined by how many poles and their spacing - we got
50 dB suppression from 300Hz to 8 KHz.
- it is quite tolerant of component variation - 5% components are probably
OK. In fact you can have a short in some parts of the network and it still
function!

The disadvantages are
- loss - the 6 pole network described will have about 20 dB loss
- many passive components.

BTW you can improve the dynamic range of switch mixers by placing them at
the "virtual earth" point of an opamp. The input resistor and feedback
resistor of an inverting opamp are arranged around the switch such that the
swicth on resistance forms part of the input resistor to the opamp. My
friend Rod Green has got a dynamic range of about 130dB (?) using this idea
which would work well in a receiver

I believe cable TV coax connectors are referred to as "F" connectors, and your best source of information about them may be your local Radio Shack store, believe it or not! They have a wide selection of these connectors, crimping tools and the packages show how to install them.

You might want to look in your ARRL handbook as well...

YIGs are cool, but they're damned hard to apply. Many have a tuning
sensitivity
of 20mhz/ma. So you'll get 20Hz of incidental FM for each nanoamp of noise
on the
tune voltage. If that sound easy, try it.....

Would you rather have Radio Shacks, or not? I love all the bitching about
the 'Shack' by people who depend on them for parts at 6PM on a Satu. night.

Speaking for myself I'd MUCH rather have them than not. Nobody's forcing
anyone to shop there.

I do not know what the resolution is (in pixels/inch), but my Dad has a nifty little scanner that can scan negatives and color slides directly into his computer. He can then manipulate them with his graphics program. I know it can do 35 mm slides and negatives and I think it can also do larger formats.

Sorry, I do not know the name of who made it, but you may want to look into this.

Hi,

I have this rummage sale that I add to as I get time. You might want to bookmark it and check back..I keep finding things in the garage, basement and attic and make a new page for each item I find. I will have alot more radio stuff listed as I dig it out.

Thanks for your time!

Jim

1866. A question/complaint

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-15 00:00:00 UTC
From: Jim <jbolinger@lintek.com>
Message-ID: <36c85fb7.0@news.netwalk.com>
Source record: 73395

This may be off topic for this group.

But then, maybe it isn't since it involves something of interest to homebrewing 'TechnoJunkies'. And I am sure that many homebrewers have asked themselves the same question about their own projects. I even see another post on here on a similar topic.

I just bought a new 'boom box' for use here at work (to help drown out the background 'monkey chatter'). It has AM/FM stereo, cassette deck, and CD player.

Now, here is the interesting part. The CD player has an LCD read out and electronic buttons (as opposed to mechanical on the cassette deck). There is, presumably, some type of embedded microchip running the thing---real state of the art stuff.

Ok, but then why did they put an old fashioned slide rule dial on the AM/FM radio? I think that another LCD readout (or even use the same one) with a simple counter (or even a synthesizer) would be cheaper than paying someone to string the dial cord. It is particularly annoying in that I have to stand up and bend over the thing (or pick it up and tip it on its front) to see the pointer when tuning---not to mention that the pointer is about 2 MHz wide on FM!

>real life.

The word you are looking for is "discriminator". To do effective slope detection of FM, the tuned circuit has to be *sharp*, in other words, it needs to be high Q. Now there is something simple that is very high Q, and that's a *crystal* (the frequency determining type, not the signal detecting type). So you *could* make a crystal controlled crystal radio and get good slope detection results. I've never heard of anyone doing this, but the theory is sound.

==========
The above type I consider the most reliable one ,in the absence of a
proper crimping tool
They are available for different types of cable .
Here in the UK they cost approx GBP 1.00 incl tax = US$ 1.60 (approx.)

I don't think you are going to be able to tune that kind of a frequency range with just a single osciallator.

I used to engineer microwave signal generators for a living. The way we covered that kind of frequency range was to use a YIG oscillator that covered the S/C bands (2-8 GHz). We took the 2-4 GHz signal and downconverted it (mixed with a 2 GHz osciallator) to cover the 10 MHz-2 GHz range. Other YIGs were used to cover 8-12 GHz, 12-20 GHz, 20-26.5 GHz. We doubled to get up to 60 GHz. PIN switches were used to multiplex the bands < 40 GHz and a coupler was used to combine in the 40-60 GHz band. The YIGs were all phase locked to a low frequency (apprx 10 MHz) reference oscillator.

Uh, what about AM broadcast receivers? They routinely tune 3:1.
You can take a pair of MV1401's and an MC1648 and easily make
a 50 to 150 MHz VCO.

Yeah, you are correct, Doug... but I bought my set in 93 or 94, when I first started getting interested in getting licensed. You would think that the bug would be fixed by now, in current production, especially since Sangean also sells it under their own label too. Did they make a half million of them, enough to satisfy demand for the next 20 years, and then say "okay... that's it, we are through"? Surely they made a few hundred here, few hundred after those shipped, maybe a thousand lot when those shipped, etc. It's been out long enough for simple but needed fixes to be seen on the street by now. And really, for the money, all that set needs is a more robust RF stage, and I would probably buy another one.

I was thinking more towards the multi-GHz range of operation,
forgetting that there are other frequency bands ;-)

Glad to see people are still using the MC1648, I designed it in 1970.
Geeeez! I'm getting old! (And then my spell checker just suggested
"Geezer" for "Geeeez" :-)

The CD portion is available as a module in itself, and is by nature inherently "digital" including the readout. The only thing it shares with the rest of the "boom box" is the power supply and the audio amlification circuitry. The am/fm tuner, on the other hand, is simply a few relatively unsophisticated parts and does not cost much. A digital tuner would cost a few more bucks.
There are more expensive models which may have digital display for the tuner, but almost always, you will find that the CD has it's own diplay. To make a long story short -- it's probably to save costs of production.

I think this one has already been done. Back in the early 80s I built a dc receiver from a 73 article, I think it was called the fun-ceiver. It used a dual-gate mosfet mixer on 40 meters, it was fine during the day, but at night...

and then there was the tuna-tin-2, and the sardine sender. If I remember right, there was a receiver too.....

I sure wouldn't want to be a newbie sent off to Radio Shack to buy parts.... Not with Mouser & Tech America just a phone call away...

Radio Shack is mostly a ripoff, except for a few items like the metal cases they sell.

I have, and it's true, noise is a challenge to get rid of in some applications. But this is not one of them. He could drive the tuning coil with a 741 and 2N3055 with no problem.

Any voltage- or current-controlled oscillator will have exactly the same problem. You want a broad tuning range in one device, you gotta pay the piper.

Smart-ass but true answer: very carefully.

The trick is to do it slowly and keep smoothing your work. Wind 5-10 rows and then put a little piece of tape on it so it doesn't fly off. Keep the wire taunt. Wrap it by turning the form; NOT running your hand around and around. That will twist the wire. If you are using that thin enameled wire you can paint the finished coil with varnish. With regular insulated wire I just use duck tape. It's ugly but it holds everything down and works fine for double layered coils. You can also write on it so you know what the coil is. IE: Primary coil for 40-meter transmitter.

Some guys wind the huge coils by putting the form in a lathe and setting it for very very slow turning.

A one channel radio <grin>. Might made a good promotional gimmick for
some radio station. A free-power radio that ONLY tunes their station.

Some time ago, I had an article published in the Australian Amateur Radio journal on generating SSB directly using a switching modulator. Various discussions in this newsgroup (on I/Q modulators & demodulators) prompted me to finish putting the details on the web.

Its all at
http://ironbark.bendigo.latrobe.edu.au/~rice/ssb/ssb.html

The article text, circuit diagrams, PC board layout & performance figures are all there. (So warm up your soldering irons & start tinkering;-)

& for all those people who, like me, thought they had discovered a new mixer or modulator using analogue switches, have a look at:

J. D. K. West - COMSIG 1991 Proceedings. South African Symposium on Communications and Signal Processing Published by IEEE, New York USA

we have all been thoroughly beaten to it!

Hi,
You can pick a hot side of the house wiring, in the wall plate the side
where narrower plug goes in, couple it thru a GOOD quality capacitor
with at least 600 volts or so rating to antenna terminal. When I was a
kid building crystal radio set, I used to do this all the time. Thru
the cap. AC voltage is blocked but RF signal gets thru.

1888. Rcvrs using parts from RS? reader asks...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-16 00:00:00 UTC
From: grogancat@aol.com
Message-ID: <19990215191142.21696.00002340@ng11.aol.com>
Source record: 73415

Yes, perhaps if you homebrew TRF you can use their RF bjt's, audio bjt's... maybe with their op amps build some crude rcvrs...maybe even some mixers might be possible.

However, if you are serious about homebrewing amateur or BC receivers, you can just about forget using RS for most of your linear needs. You can find Jfets for some projects but for the most part, RS caters to non-RF types.

What you will find handy are the cabinets, knobs, pwr xformers, rectifiers, wire for winding your own coils (i like to wind with #38 very fine wire for my IF transformers- RS doesnt carry wire that fine...), hook up wire, solder etc etc..

What you wont find when you start REALLY homebrewing are the hot-carrier diodes/wire/torroids, tuning diodes, air variable capacitors, limited values of capacitance suitable for HF work, mosfets etc etc...

Used to...back in the before times.. back when you could buy one resistor if you wanted.

I heard that RS will be getting out of the component buisness anyway, their partner TECHamerica is doing a fine job and I use their catalog and Dan's small parts...as well as local hobby electronics suppliers for my SBL-1's and stuff. But I would be hard pressed to be able to come up with a nice homebrew receiver of any sort using just what was available inside most RS stores. Like spock said...'bearskins and stone knives'

One tip is to wind two wires at a time on the form of your choice, staking the first, say, and then unwinding the second. You get a coil with even spacing. Technically, it doesn't matter much if the wires are that perfectly spaced. The other way is to use a coil form with grooves in it, if you can find one. Self supporting coils need to be annealed to fix the new shape.

Ray (and the Mailing List),

One method that delivers high quality results is to wind your coils on a lathe using demountable coil forms.

The forms are made of hardwood blocks about ten inches long fastened together with a recessed brass screw at each end, installed from opposite sides. The screws are installed at an angle so as to be parallel to the ends of the form. The ends of the block are then cut parallel to each other but at an angle to the parting line. The centers are then found. Because the parting line is at an angle, the ends of the block are solid. A brass plate and dog may be installed to facilitate centering and turning. The block is turned to the desired diameter. If things have been properly laid out, removing the screws will allow the block -- now a cylinder -- to come apart in the form of a pair of tapered cylindical wedges which mate along their flat face.

You should end up with a cylindrical form about nine inches long on which you may wind a coil eight inches or less in length. You may of course make a longer form but since it is held together only on the ends the maximum length is a function of diameter. (My 1" form is about 4" long.)

The cylindrical form is then grooved with a router to accept styrene rod of a given diameter suitable to the coil, the grooves falling entirely within a given half of the form so as to leave the parting line unobstructed. Four grooves is the norm but with larger diameter coils six grooves are possible. Suitable styrene rod is available from plastic suppliers. Depending on the diameter of the coils you plan to make, you'll need several diameters of styrene rod, that is, small (1/8") for small diameter coils and heavier rod (5/16") for larger diameter coils made of heavier gauge wire.

The form is then finished with varnish, and marked according to diameter. If you do much building you'll eventually have half a dozen forms, from 3/4" to 3" diameter.

The form is used with a wire feed and tensioner which you'll also have to make. Coils are normally wound from tin-plated solid copper wire, which is fairly expensive stuff. Even so, it is best to buy an entire roll of the wire and design your wire feeder to accept the standard rolls.

In use, the form of the desired diameter is chucked into the lathe, styrene rods cut to length and attached to the form with tape or wire and the lathe set to feed wire at the desired pitch and tension. Tension is kept fairly high in order to accomodate the following step.

Once the coil is wound -- it takes only a few minutes -- the wire may be cut and secured to the form, either to an eyelet or by threading the free end of the wire into a hole drilled in the form for that purpose. The completed coil is then HEATED, usually with an industrial grade hot-air gun such as you'd use for heat-shrinking. The heat softens the styrene. The highly tensioned coil then melts itself into the styrene rods.

A fair degree of experience is needed in the heating, especially with smaller coils. The object is to melt the wire into the rods so that the styrene covers the wire. But if you let it melt too deeply you will upset the process for the remaining rods and may alter the diameter of the finished coil. The depth of the grooves you've cut to accept the styrene rod has a lot to do with your success, as does the pitch of the winding -- you may find it more convenient to make forms of identical diameters but having slightly deeper grooves for coils having a finer pitch. But in most cases, the diameter of the wooden form determines the depth to which the wire can melt into the styrene.

Once melted all around, the styrene is allowed to cool. The brass screws are removed and the wooden form driven apart, leaving you with a air-wound coil indistinguisable from those commercially available.

I'm sorry I can't provide you with a sketch. My operating system does not support any of the commonly available CAD programs and what it does support, no one else seems to have :-) (ie, NT 3.51)

I understand the inclination to caution people about the use of the zip-cord coupling capacitor; but, homebrewers routinely build equipment powered from the AC lines. Some level of competence has to be assumed in a newsgroup about amateur radio and homemade equipment. Don't get me wrong, we all need to be careful about *all* homebrew equipment that connects to potentially lethal voltages...but... assuming such an antenna is properly constructed and insulated, I don't understand why its use is any more risky than (for example) touching the cord on your living room lamp while it is plugged in.

Perhaps the risk is in having a transient coupled to the receiver front end, but then any long wire antenna carries this same kind of risk, does it not?

In the days of AC-DC table-top radios, wasn't it common practice to use a small value, high voltage capacitor coupled to the AC line as a "built-in" antenna?

Straighten me out here, gang!

Unless you want to do something else with the binary representation of the frequency, it's most likely much easier to simply do the counting with decimal counters. As you figured, it's common to use a count time of 1 second, but you may not need that much resolution. Perhaps 1/10 second would be OK, giving 10Hz resolution and faster response time. It's up to you. It's common to have latches which hold the previous count for display while the counter is performing another count. Also, since you know the LO is within some small range of frequencies, you don't necessarily have to count all the digits. Perhaps just 100kHz, 10kHz, ..., 10Hz are enough, and you can assume the 14MHz (but if the display reads 990kHz, you know it's really 13.99, etc.)

You could do the whole counter in a field programmable gate array or a medium size CPLD. You could also use a simple microcontroller to do almost all of it...perhaps everything. I think that a 20MHz PIC processor can count up to 20MHz, but I'm not positive about that.

> if you observe this effect!

When I was an electronic engineering student in the 1960's,
the teaching lab had a Tektronix transistor curve tracer.

I tried putting various old-time radio crystals on it.
Regions of negative resistance were relatively common to
find. Not sure if they were due to tunnelling or other
effefcts [eg avalanche breakdown?]

In the 1930's there were sometimes references to 'oscillating
crystals' [and they were not talking about quartz]. Sorry
I don't have any references now.

Take care,
Martin

2N3724
2N3736

These are some of the Transistors that I have in the 2N series and would like the specs for my list.

Also does anyone know of anywhere that I can find the information for alot of other transistors that I would like specs on, which include series...AC, AF, BC,
BF, ETC ETC.

Many thanks in advance

Hello

Does somebody have any information about Alinco EL-2H 2m PA (SSB/FM). I am interested in approximate outout power, type of PA transistors, perhaps schematics. It`s an old one and has lost the transist�rs but in general looks quite healthy to me so I am eager to restore it.

Thank you in advance

You can observe negative resistance in 1N35 diodes at the reverse voltage breakdown point. This is discussed in the Crystal Rectifiers volume, No. 15, of the MIT Radiation Lab Series and was even presented as a project in a Sylvania germanium diode booklet. I tried it, it worked well in an audio oscillator. Been meaning to go back and try it at RF frequencies.

Harvey,

Download in a few seconds, not zipped-up, program
SOLENOID.exe

Its just what you need to design air-core solenoids of any
length, diameter, turns, wire size, winding pitch. Other
programs, mainly antennas will design
loading/tuning/Z-match coils as part of an antenna's
performance analysis. Take a look at ENDFEED, TRAPDIP,
TANT136, VERTLOAD. All relatively new.

TOROID does what it says. But its no better than the
accuracy of data you put into it.

Hello--
Most AC/DC tube-type receivers used either a loop antenna wound onto the radio's read cover or (in later years) a ferrite loopstick. RCA used a Faraday-shielded loopstick in its 1960s models (IIRC) that worked better than average.

My folks owned a 1950-vintage Zenith AM/FM receivr that used an FM antenna coupler consisting of a metal clip that fitted over the AC line cord and connected to an antenna terminal.

Inside these receivers, a capacitor coupled the "low" side of the AC line to the chassis. If this capacitor leaked, the user (or repairman) had a 50-50 chance of getting zapped when touching the chassis, depending on which way the line cord was plugged in.

Never use tinned or tin-plated copper wire for RF coils.
Considerably more lossy than bare copper.

Use silver plating if you like a pretty finish but silver
does not signicantly reduce loss relative to bare copper.
Silver also tarnishes rapidly.

Keith, I have the EPROM burner you refer to. Unfortunately, I don't know what format Standard uses to burn the chip. I have a copy of a file that Standard sent me, but I have no idea what the different digits in the string represent (freq, CTCSS, channel, priority, etc.) If you send me a 2716 EPROM and the info you want burned, I can do it for you with the AR3400 (I think that's the burner model number).

1910. Tower Electrical Length or Dipping a Tower

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-16 00:00:00 UTC
From: Joe Shuey NE3H <ne3h@access.webcombo.net>
Message-ID: <36C98BAF.2B1E76D7@access.webcombo.net>
Source record: 73437

I've tried the determining the resonant height of my tower. I've climed it, attaching a wire at the top, and puttting a couple loops at the bottom. Then using a grid dip meter. But the was no distinct dip anywhere in the expected frequency range. I've talked to a couple others who have also tried (and failed) to get a reading by this method.

Anyone out there that has had success with this method?

Thanks

>
> 73,
> Jay

There are at least two issues here.
1) DC receivers are extremely sensitive to junk on the power supply. The counter
is gonna generate
a lot of junk on the power supply.
2) The counter is gonna generate huge signals at harmonics of all the frequencies
in the clock divider chain. It will also generate huge signals at harmonics of
subharmonics of the input
frequency. And the display update freauency...and...

I use an external counter on my spectrum analyzer/tracking generator to tune
cavities.
Plugging on the counter raises the noise floor about 20dB.

Shield and decouple it real good.

Why would anyone want to build a DC reciever??? Simplicity??? Low power????
Small size???? Not if you add a frequency counter.

> Sorry for all the yelling but I want to be clear about those points. :)

Boy does this bring back some memories.
Actually this was done, at one time. It was known as carrior-current,
I beleave. (Correct me if I am wrong). The technique was use mostly
for limited range BC band stations. Either unlicensed or ristricted
licensed use. We had one on our campus, at one time.

They would couple the output of the transmitter to the AC line,
enabling the reciption of the station by people whose houses,
businesses etc. that where connected from the same feed from the
power sub-station. The transmitter was supposed to be low power,
10 watts or so.

I remember my grandfather telling me of instances, though, where
someone would use higher power.. 1000 watts or more. This created some
rather bizzar effects. Like talking washing machines and refridgerators,
lights that went on by themselves etc. Can you imagine the reaction
peole had to these accourances.

I do not know if this is still done or not. I have not heard of it
in a number of years.

How are these typically made? I mean, you take a 10W radio, pump that
10W into a transvertor, and it outputs some greater amount on another
band. I'm only familiar with low-power mixers (like from MiniCircuits),
so do they use heavy duty mixers or just attenuate the input signal?

It is possible to build an active mixer that has gain.
Usually, the signal is attenuated, passed thru a low level lossy mixer
then amplified again.

One nice approach to this is to build a low-power radio expressly
for driving transverters. That way you get just the right transmit
power output, separate TX/RX paths, and all the proper control
signals. No messing around!

Since you will never hook it up to an antenna there is no
requirement for a ham band IF. This solves many problems.

High-level mixers were popular in the Time of Tubes, but tend to
be only an historical footnote now.

1922. Re: PL177A info?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-16 00:00:00 UTC
From: ax9909@aol.com
Message-ID: <19990216173106.17419.00002554@ng03.aol.com>
Source record: 73449

the pl-177a is a glass , 5 pin tetrode.

plate diss.=75 watts
plate volts=2000 dc
plate amps=150 mils.
screen diss.=10 watts
screen volts=600 dc
fillament voltage=6 ac
filament amps=3.5
class C output= 100 watts at 1000 vdc
" " " = 210 " " 2000 vdc
this tube is used in the final of the PRC-47

now for your other question, if this tube looks anything like a 4cx-1000 it's
not a pl-177
sounds like you have a pl-172 which is a 1000 watt tube like the 4cx-1000.
check the number again, i think you made a mistake!
good luck & 73.......george

Surely not at the same time?

Incidentally, I found a '9-Pin Miniature Tall Test Socket Adapter'
Model 1449 by Pomona Electronics of Calif. It extends the valve base
of an awkwardly placed B9A valve base out by 5.5cms with a base on
top for the valve and nine tags to connect instruments to for
measurements. Do you want it?

1925. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7actgb$r7j@news.Hawaii.Edu>
Source record: 73452
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, WH6U, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your

article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

A grid dip meter is NOT the way to go about it. Use a RF bridge such as a General Radio 1606 or 916. You will have better luck. It will tell you the resistance and reactance at what ever frequency you want to look at. Sparks W4EAS

It begs the question, who strung the dial cord? more than likely a young asian girl making a dollar or so to string 300 units a day. Most of these "combo" radios are built from pre-existing components mixed and matched to come up with a finished product, the CD player was probably installed as a finished assembly and has no connection to the radio other that mabye interfacing with the audio amp. So building an interface so that the radio and CD player can share the same LCD display is definatly not cost effective. As a manufacture you could certainly design the radio from the ground up, but why when you can buy the CD player for $4.95 and the AM/FM board for another $1.97 and then build your system from existing components?

I've picked up one of the Cherokee 6m FM HT's on closeout for $99.99 and let them keep the penny. I've been wanting to do some AM work on 50.4, can I tap into the last IF of the radio and just send it off to an AM radio at 455Khz? It seems to me it would work fine. Have I missed something? Oh, the transmit comes from an Ameco TX-62 not the HT :)

If this is OK, would I need to disconnect the discriminator or should there be enough signal there to just tap into?

If it is a GX3000, you don't need an eprom burner, you need the radio service software, and the right programming adaptor for your PC.

Hehe. Reminds me of my Pop's old Hallicrafter SW radio. Before I traced the wiring and put a 3-prong polarized plug on it, the radio use to bite me all the time. With the plug on one way the case was hot only when the radio was on. With the plug in the other way the case was hot all the time. I connected my voltmeter between the case and ground. You know what I found? 90 VOLTS on the case!!! It frightens me that he used it that way for over 50 years. Maybe that's why his hair is sticking up in all those old photos. :)

After installing that grounded 3-prong plug the case shows zero volts. Much better.

That radio is a real champ. Original tubes and still working.

|> so do they use heavy duty mixers or just attenuate the input signal?

Some radios like the Kenwood TS 850 can be programmes to turn off their
internal PA and the deliver only about 100 mW to the transverter.

Hi,

I am trying to make a variable RF attenuator using PIN (1N4007) diodes.
Apparently, in QST June, 1994, Ulrich Rohde, published such a project.
I do not know title or page numbers.

Local library is not helping me find QST magazines.

Really need help getting a copy of this.
I'll be happy to pay copy and postal costs for this article.
Thanks for any help.

Source record: 73279

Not quite so Allan. There are no programming ports on the GX3000M, U, V models. All radio specific data is stored on a 2716 EPROM. To change the data, you must erase the existing stored info (usually with UV light) and reprogram with the needed data for freqs, tones, priority, scan position, etc. Perhaps you are thinking of one of the newer Standard radios that do have an "RS-232" type port for direct data entry. 73 de VE6INM (Glenn) In article <36CA37DA.C2BB16F7@cadvision.com>, Allan <doblera@cadvision.com> wrote:

Hello--

Thanks for your comments which reminded me of another design "gotcha"
in these older radios. The designers frequently placed the on/off switch
in the return leg of the AC power cord. Depending on where the bypass
capacitor was connected, the chassis of the receiver could carry AC
all the time-- either directly through the bypass cap, or through the
series string of heaters and bypass cap.

With the switch on the hot leg of the ac line, at least the chassis was
"cold" half the time<g>.

Correct. Have a look at www.heidelbergusa.com under products -
prepress - input - Topas XL.
It's a 11,000 dpi (!) drum scanner - should be sufficient for
micro films or alike. Try to find a company in printing / prepress
business they should have a drum scanner. I suppose you wouldn't
buy one for yourself as they are $100,000+ ;)

Does anyone know a good cheap source for these components? I am interested in the K and X band.

Also if anyone knows a good source for electronic components in general? I know who the regulars are but I was hoping to save some money.

A website would be the best but a name would be just fine. Also please respond to email or email + newsgroup so that I don't miss your reply. You must remove NOSPAM from my email address.

Thanks Greg

I have a pretty large variac transformer that I'd like to
sell. It's 7"diameter by 4"high, weights about 25lbs, in
excellent condition. It's marked as follows:

General Radio Co type V20H
"Volts shown for 8amp 0-270V 50-60Hz"

I assume that refers to the fixed voltages between
the various taps. It has 7 terminals; 1 terminal for
each end of the winding, 1 variable slider, and 4 fixed
taps for various fixed voltages.

This thing is quite substantial. I don't know what it's worth.
If interested, make me an offer.

Thanks,
Joe
KB2FSH

PS - I also have a couple of smaller ones. If your interested let
me know and take a look at them for the specs.

Gang,

In the world of boatanchors and the meticulous hobbyists who lovingly restore them, there are those who go absolutely ballistic when you suggest rewiring and old rig with a modern and safe 3-prong AC plug. In their minds, it is an unconscionable act of desecrating an original classic in it's historic but dangerous condition. The maintain-everything-original vs. bring-old-rigs-up-to-modern-safety-code debate still rages, and probably will never, ever be resolved.

R,

Al

Hello--
One can solve the problem neatly by purchasing a suitably-rated
isolation transformer and dedicating an isolated outlet strip to the
old equipment. Spending even $200 on an isolation transformer is
cheap insurance-- how much is one's life worth? And imagine all
that wonderful old equipment going to the dump because you wouldn't
be there to restore it....

In particular the 651K, 658 and 659 model numbers
would be most helpful. But, I would be interested
in a manual for any PI for this mainframe. Willing
to pay (sort of) big bucks.

thanks,
Steve

The power transformers in a lot of modern equipment have two primary windings which are normally connected in parallel for 115 volt and in series for 230 volt operation. You can often find these quite inexpensively on the surplus market, and can use the primaries as an isolation transformer.

I heartily recommend an isolation transformer for the old gear if you don't want to modify it. Connect the chassis to the mains safety ground (but only when it's powered through the isolation transformer).

well, if the range is short, and you have good error correction, try the guts
out of a cordless phone. not a cell phone, just a plain old wireless phone.
i'm sure that it would get allot of static, but just be sure you have some
good error correction protocol. like using a couple of old HST 9600 baud
modems on each end of the connection, with some packet radio software that
will take care of data integrity.
all of those things could be had pretty cheaply.

I've been very happy with http://www.shfmicro.com. Very responsive and knowledgeable "tech support" from Alan! They don't take credit cards or phone orders, though -- you have to order via email or fax, and pay via snail mail or COD.

>
> Also if anyone knows a good source for electronic components in general? I
> know who the regulars are but I was hoping to save some money.

http://www.newark.com has almost everything, but they can be somewhat expensive. Their printed catalog is the size of a major metropolitan telephone book, so the higher prices are somewhat justified IMHO.

http://www.digikey.com has less stuff, but it tends to be cheaper than Newark.

http://www.mouser.com and http://www.circuitspecialists.com can also be good places to look.

Better to desecrate the radio than my sweet little self! <grin>
I know what you mean though. No doubt I took a lot off the resale price.
Oh well.

I'm curious. In restoring a radio like that, where would you find one of
those antique cotton-covered powercords anyway? I'd think a "new" old
cord would be just as moldy and stiff as the 50 year old original was.

1968. HELP: Multiple Antennas on Same Mast

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-17 00:00:00 UTC
From: Christopher Heath <heath_filtered@s2i2.com>
Message-ID: <7aga80$g18$1@news.ncal.verio.com>
Source record: 73302

I have two tripods at the peak of my roof. I would like to consolidate all my VHF/UHF J-Poles onto one mast. That would be a 6-meter (yet to buy or make), a 2-meter, and a 70-centimeter.

I am thinking if I don't position these right, they will affect one another. I suspect I would never use more than one at any given time, as is the case now, but I believe I read somewhere that metal (like another antenna) within some specified distance of the the radiating element of an antenna puts it out of tune and affects the SWR.

I am also looking for design plans for a 6-meter J-pole. I have found one or two but if anyone has a favorite design thay want to point me to, I'd appreciate the input. Or maybe someone knows of a good retail source for a j-pole antenna.

Thanks.

A bitmap file is a graphical file (LIKE A PICTURE or A DRAWING) however, a graphical file needs a program to view the graphic. Corel, Photomorph and even Internet Explorer can open a Bitmap image file. The virus uses certain setup files within the Bitmap viewing program to open it. It is this process that embeds the virus in the registry of the host computer. The rest is literally history.....Like I said, it is very, very nasty. Especially if one doesn't back up files on a zip drive or jazz drive often.

1980. GE Custom MVP Transceiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-18 00:00:00 UTC
From: "Ralph J. Gable" <rgable@cancom.net>
Message-ID: <36CCD9E7.6F93@cancom.net>
Source record: 73232
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,rec.radio.amateur.homebrew

I have a GE Custom MVP single frequency radio transmitter-receiver.

The numbers on the back are
EU:CT56AAS66A
SERIAL: 9110909
KT: 134-A DOC: 101264429
ER: 92-A DOC: 101264430
OPTION: 1928

I have no data on this radio and am looking for manuals, schematics, or
any data that may be available on it

Please reply by e-mail to: rgable@cancom.net

Thanks . . .

>>U310 or the (obsolete?) P8000 are the most likely substitutes.
>>

I have seen folks parallel a number of U310's to get a higher
g-sub-m like the CP640 has. It might be worth a try.

Hello, everyone, I have a mint shape HW101 (from Heathkit) to give to a new home. The unit doesn't have a vfo, but everything else in installed. The unit was put together by Heathkit many years ago, used for about 100 hours, then the vfo was removed(I was helping a friend out with his unit and gave him mine).

The chassis is mint, contains all tubes, parts, etc...anyone like to have this piece of history? Well, you pay shipping and the rest is yours...

Thanks Everyone,

Lee

Hello Dave,

Some paper was written on this in "Radio Communications" the RSGB
Journal, it was called pin-diode attenuator.
I have used this princple in providing automatic attenuation of signals
arriving at my FT101 transciever years ago. I set the attenuator to
automatically hold signals to the "S9" level when overloading.

BTW: Many libraries hold QST, its a matter of the issue that the
appropriate article is in.

Hi,

What's the purists view one using polarized plugs instead of the 3
prong plugs? Not like I worry about it, like the man said the debate
will never be resolved.

Or an inductor. I hope he is not using some form of lossy core in the input tuned circuit. The other possibility is the antenna or the coax. I found my RG213 coax was melting on 20m while trying to deal with 400W into the 80m vertical - must have been the VSWR. The ATU didn't mind at all. At 1kW type powers and a good VSWR, thinner type coax and thin wire dipoles will get hot.

The deadliest virus Ive seen lately is called DOOMSDAY 9. Someone will send you a Bitmap file via email and when you open it the virus is put into RAM. Its held there until the next startup (just like SAVE SETTINGS ON EXIT), and then wraps itself around the registry upon reboot. The virus itself is triggered when a SCREEN SAVER program kicks in. The creators of the virus knew if you screen saver engages, you most likely wont be in front of your computer.

The 1st thing it starts to gobble up (once the screen saver engages) is *.INI files. Once done it looks for *.DLL files and then finally *.EXE's. By the time you realize (when you return to your system) happened, its usually too late. This one is nasty!

A friend of mine sent a zipped up file of this virus to use on obnoxious jerks however, even they are too good for this bad-boy.

You'll have to tap in before the limiter, or the AM will be gone. So you
need to tap at the output of the mixer, not the last IF stage, because
the limiting is done in the IF.

IT WILL KILL YOU, IT WON'T KILL YOU. IT'S SAFER WITH A THREE WIRE CORD, BUY AN ISOLATION TRANSFORMER. IS TRUTH IS A POWER LINE DOESN'TMAKE THAT GOOD AN ANTENNA. YOU HAVE A PREMIUM SEAT FOR EVERY BURP IN THE LINE FOR TEN MILES AROUND.

IF YOU WANT TO TRY IT, DETERMINE WHICH WIRE IS WHICH AS COMPARED TO THE PLUG. HOOK ONE WIRE TO TO THE ANTENNA POST. DISCONNECT THE OTHER WIRE FROM ITS TERMINAL IN THE PLUG AND CUT IT BACK ABOUT TWO INCHES. THIS LEAVES A "CAPACITOR" OF INFINITE VOLTAGE RATING BETWEEN THE LINE AND THE ANTENNA POST. REVERSE THE PLUG TO SEE WHICH WORKS BEST.

P.S. DON'T EVER TRUST THE CONSTRUCTION (OR LATER) ELECTRICIAN TO WIRE THE SOCKET PROPERLY.

1998. Trouble modulating old AM tcvr

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-18 00:00:00 UTC
From: Joel Govostes <jgovost1@twcny.rr.com>
Message-ID: <36CC3325.A515737B@twcny.rr.com>
Source record: 73318
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

Having difficulty with modulation of the final amp of a 1960's era,
tube-type AM transceiver.
Modulation extremely low on the output. Not sure just why. Here's
something I've noticed; perhaps it could be diagnostic(?):

When I key the mic, the output level shoots right up, as read on a field
strength meter, but
immediately starts dropping back down gradually. Within seconds it
reaches a
final value partway down scale from the original instantaneous "peak,"
where it
remains. If I un-key the mic, and wait a couple seconds, then key up
again, I see the
instantaneous peak once again, followed by the drop. I do not see any
peak if
the mic is keyed rapidly in succession.

Besides this, I notice that the fluctuation on the rig's rel. pwr. meter
is only slight, while speaking/knocking/tapping the mic. There should
be a much more noticeable "flicker" on
the meter reading, according to the manual. What fluctuation there is,
is swinging *downward*,
instead of producing any increase in the relative pwr. output.

Any suggestions as to what might be going on here? The rig is a '60s
Lafayette, (HE45b, 6m): 2E26, plate modulated, single-ended mod.,
connected quasi-Heising style thru secondary of AF output tfmr).

Grateful for any help on this;

tnx vy

****

Another thing to try is to tune it off channel so that one
of the AM sidebands is rolled off in the I F filter. This leaves you
with a carrier and one sideband that will undergo AM to PM
conversion in the limiter and the FM demodulator will
respond to it.

Depending on your channel steps and filter slope, it may
be all you need to monitor , and can give a reasonably
intelligible output to AM . Only takes a second to try it and
you could get lucky.

Transmitting is something else entirely... (grin)

Good Luck,

Andy in Dallas W4OAH

2002. FS: electronic-construction hardware (long posting)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-18 00:00:00 UTC
From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <36CC61C8.2B40@pop.valley.net>
Source record: 73322

FS: an assortment of NOS (new old-stock) electronic assembly hardware for constructing amplifiers, preamps, and other projects. Here, you'll find octal sockets, tie-point strips, turret-lug terminals and terminal boards, capacitor clamps and more. Reserve your choices via e-mail. Scanned images of any components are available upon request.
****

Capacitor mounting clamps, similar to Mallory type VR-3; plated steel
Accommodates capacitors or other cylindrical objects from
1.375" to 1.5" in diameter.
Dimensions: 0.75" high by 2" (across clamp and flange)
Mounting: two right-angle feet with holes on 1.75"- 1.875" centers
Clamping screw, nut and washer included.

Price: $.75 each, $6.00 for 10 pieces.
****
Six-lug terminal strips: like Keystone p/n 825: six isolated, tinned steel lugs mounted on a brown phenolic insulating strip, arranged in groups of three on either side of a central mounting bracket.

The lugs are spaced on 0.375-inch centers; mounting bracket has a 0.140-inch hole (use a 6-32 screw for chassis mounting).

Prices: $8.00 per 100 pieces, $15.00 per 200 pieces, $45.00 per 1,000 pieces.
****
Teflon (tm)-insulated turret lug standoffs: Cambion p/n 570-1511-01-05-19. White base, silver-plated terminal. Use a 6-32 screw for mounting; standoff voltage is 3300 VRMS.

Prices: $.15 each; $1.00 for 7 pieces; $12.00 per 100 pieces.
****
Spring-loaded component clips: Midland-Ross 410-4521-01-08-19 (Cambion p/n 4521-01-08-19). Use these where you need to substitute components or provide semipermanent connections to transformer leads; these are insulated feed-through terminals with spring-loaded grippers.

Install via press-fitting into a 0.215-inch dia. chamfered hole in panels
up to 0.125 inches thick. Flashover voltage is 2500VRMS with 0.032-inch panel. Tinned nickel-plate, white base. Accepts AWG#17-AWG#24 leads.

Prices: $1.25 each; $10.00 for 10 pieces; $20.00 per 25 pieces.
****
Terminal boards: these consist of turret lugs staked into epoxy-fiberglass boards. Use these when you need to mount components

in groups or rows.

Several styles are available:

Style 1: Interconnection Products Inc. p/n 200-1333-21-01-02 (similar to Cambion 1333-31 with type 2043 terminals):

Consists of two rows of 0.186-inch high turret terminals (5 per row) on 0.816-inch centers, staked in 0.0625-inch thick board. These include four mounting holes per strip.

Prices: $1.25 each; $5.00 for 5 pieces.

Style 2: Interconnection Products Inc. p/n 200-1405-25-01-02 (similar to Cambion 1405-21 with type 1558 terminals):

Consists of two rows of 0.219-inch high turret terminals (5 per row) on 0.750-inch centers, staked in 0.0625-inch thick board. Supplied as a single board combining five groups of 10 terminals in a single strip (i.e., 50 terminals total). The individual boards are not scored but could be separated to yield five individual boards per strip. These include four mounting holes per substrip.

Prices: $5.00 each; $24.00 for 6 pieces (factory-packed in pairs).

Style 3: Litton Inc. p/n 8001-B-16 (similar to Cambion 1403-55 with type 1724 terminals):

Consists of two rows of 0.359-inch high turret terminals (5 per row) on 2.0-inch centers, staked in 0.125-inch thick board. Supplied as a single board combining five groups of 10 terminals in a single strip i.e., 50 terminals total). The individual boards are scored for to yield five individual boards per strip. These include four mounting holes per substrip.

Prices: $7.50 each; $12.00 for 2 pieces.

****

Cable clamps: MIL- MS-21919WDG4 metal clamps with rubber liners; accept 0.25-inch cable bundle.
Prices: $.15 each; $1.00 for 7 pieces; $12.00 per 100 pieces

****
Octal wafer sockets: brown phenolic two-wafer style with mounting holes on 1.5-inch centers; two rivets hold wafers together.

These sockets were manufactured in 1950 and show some oxidation on the terminals (which may require selective retinning) and assembly rivets. However, the wrap-around style contacts' gripping force is adequate to make good electrical contact with tube pins. Not exactly premium quality,

but these inexpensive sockets will serve for breadboards and prototypes.

Prices: $1.00 for 5 pieces; $15.00 per 100 pieces.

****
Ordering information:
****

Reserve your purchase via e-mail, and pay by check or money order made
payable to "Brad Thompson". Add postage as shown:

Shipping for orders up to $50.00, add $4.00 for insured priority-mail
delivery to U.S. addresses. For orders over %40.00, add $5.00 for
insured priority-mail delivery.

Overseas purchasers: please inquire for postage.

****
Warranty and Warning:
****

If you purchase these components and find them unsatisfactory upon your
inspection, you can return your purchase for a refund within seven days.

These components are subject to prior sale and are supplied as-is, as
new-old-stock (NOS) merchandise, with all responsibility for safe and
successful application residing solely with the purchaser.

Perhaps a soft 2E26 output tube?

The only way to ascertain what the modulation is doing is
to use a scope on the RF envelope. Relying on "meter flicker"
is a very poor method. Average power does not change with
modulation, and there is no desirable meter indication for
showing modulation by monitoring RF output or plate current.

You can recover AM from the RSSI output of FM receiver chips.
See if your receiver uses such a device. Output will be low, but
it does work.

Since the RSSI is used for things like AGC and squelch and
S-metering, shouldn't it be low-pass-filtered into sub-audio?
Or is that normally done off-chip before anyone else uses it?

2007. Looking for a "peculiar" power transformer for audio applications

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-19 00:00:00 UTC
From: Tom <tom22@verio.com>
Message-ID: <36CCC4AA.64744385@verio.com>
Source record: 73236

Hi,

Actually, the transformer that I am looking for isn't THAT peculiar or unique, but I just can't find it anywhere. I am looking for a dual primary (for either 120VAC or 240VAC) triple secondary power transformer. One secondary winding is for, say, 10VAC from which +5 VDC will be made. The other two secondaries, which could be a center-tapped autotransformer, will be for 25VAC, from which +/- 15 VDC will be made. All that might seem strange to get from one transformer but if one looks around at power supplies, one sees that +5, +/-15 Volt supplies are quite common, especially for use with audio systems.

I have tried a number of web sites (all the obvious ones) but can not find the transformer that I am looking for. Please help if you can lead me to the right manufacturer.

Thank You
Tom

Microtran (digikey carries them) has a similar one to your description.
Actually the analog supply secondary is center tapped.
Expensive. Can't you use +/-5 for your analog supplies? Then you could use
a garden variety transformer.

Or, if your quantities justify it, have a custom tranformer wound with one
secondary at 10V and another at (say) 15V and use two half-wave rectifiers
(2 diodes) for the analog supplies.

In the case of the Microtran product you would just use a
bridge rectifier to create the two analog supplies.

All transformers like that are regarded by the industry as 'custom' and
do not feature in catalogues or lists. How many of them do you want?
Some manufacturers will make you as few as 12 (although the price may
not be attractive, it wouldn't be unreasonable) whereas others won't
entertain any orders for less than tonnage.

You just have to call manufacturers with your spec and ask.

From: Ken Simpson <W8EK@usa.net>
Message-ID: <WKez2.53$VP1.328@monger.newsread.com>
Source record: 73243

For Sale:

Sencore TR-139 transistor tester. Can measure in circuit as well.
Appears like it should work OK, but I can not seem to get it to zero
correctly. It may be the tester has a problem, or it may be I have
the problem knowing how it should work. Cosmetically in good shape.
Probes included. $ 20

Keithley 169 DMM. This is a 3 1/2 digit DMM, with an LCD display. Auto
polarity. Operates off of 6 "C" cells (or appropriate adapter).
Fraction of a percent accuracy. Lab quality. Manual included $125

Prices do not include shipping from Florida.

E-Mail to W8EK@usa.net

Thanks.

Swap meets. Look for the ex-intruder alarm units. I've bought loose
Gunn diodes from Birkett in England. Mainline carry them too.

You might have a look in the Yellow Pages and see who sells/services
radar intruder alarms and automatic door openers in your area.

With that said, I'm still trying to find where the TTC get the
24 GHz Gunn units for the doors at Toronto subway stations... :-(

VCRs have disappeared repeatedly from the local volunteer center where I donate some of my time.

Others at the center suggested securing the equipment to tables, locking doors, etc, but since the general public doesn't have access to this part of the building, some of us feel that it is someone (or someone's child) who attends regularly. I want to get this (ahem...) individual on video "en flagrante" (in the act).

A camcorder (with auxiliary video input capability) will be used for the recorder, with a pinhole camera (NTSC output) placed either inconspicuously high in a corner of the room, or behind a panel in the TV/VCR stand/cabinet, providing the surveillance. (Placement of the camera will be determined by available light (we don't want to get just the silhouette of the thief walking away with yet another VCR) and probable entry/exit path into/out of the room.)

An alarm wouldn't be very helpful here, because there is seldom someone nearby when the thefts occur and by the time someone appeared on the scene, the thief would probably be gone (with or without the merchandise).

I need help with some of the planning:
1) How can I create a circuit that senses that the VCR has been picked up or unplugged: If I place the camera and recorder in the TV/VCR stand, triggering of the record mode can be via wire. If it's placed elsewhere in the room, triggering would be have to be done via RF or other link. Any sensing circuit must be unobtrusive; the thief will be unplugging the power cord from a standard extension cord into which the TV is also plugged, and so there can't be any suspicious circuitry between the VCR plug and the extension cord...

2) Triggering the record function on an old Sony CCD-V9, 8mm camcorder: how can the camcorder be put in record mode automatically?

Any suggestions would be greatly appreciated.

Sorry for the modified return address, but I hate getting spammed.
My correct return address is provided below if you choose to e-mail me.

Thanks,
Dave

What you can do is install a loud sono alert inside the machine.
These are easily available. You wire an AC relay that can work
accross the mains comming inside the machine. The relay contacts are
in series with a 9 volt battery to drive the sono alert. When the
machine is unplugged the relay snaps shut closing the n/c contacts,
and the alert screams away. Put a cheap keyswitch on the side to
allow you to move the machine. You can mount the sono alert on the
inside with some 2 way tape. You will have to drill a 1/8 inch hole
where the alert outlit is so that the alert can scream through the
metal cabinet.

For the moving switch, do not use a hidden switch or something like
that. The kids will learn that very very fast!!!

Remember to open and change the battery about once a year. And test
it periodocaly to see if the battery is good. The total cost is
about $40 in parts.

Don't forget that during powerfailures you will have the machines
screaming away. Just walk over and turn off the switches
temporarly... If it screams for a few hours you will have to change
the batteries...

I had a few contracts of this nature for some institutions. We had to
do about 100 VCR's and TV's for several places.

DaveC wrote in message ...
|VCRs have disappeared repeatedly from the local volunteer center
where I
|donate some of my time.
|
|Others at the center suggested securing the equipment to tables,
locking
|doors, etc, but since the general public doesn't have access to this
part
|of the building, some of us feel that it is someone (or someone's
child)
|who attends regularly. I want to get this (ahem...) individual on
video
|"en flagrante" (in the act).
|
|A camcorder (with auxiliary video input capability) will be used for
the
|recorder, with a pinhole camera (NTSC output) placed either
|inconspicuously high in a corner of the room, or behind a panel in
the
|TV/VCR stand/cabinet, providing the surveillance. (Placement of the
camera
|will be determined by available light (we don't want to get just the
|silhouette of the thief walking away with yet another VCR) and
probable
|entry/exit path into/out of the room.)
|
|An alarm wouldn't be very helpful here, because there is seldom
someone
|nearby when the thefts occur and by the time someone appeared on the
|scene, the thief would probably be gone (with or without the
merchandise).
|
|
|I need help with some of the planning:
|1) How can I create a circuit that senses that the VCR has been
picked up
|or unplugged: If I place the camera and recorder in the TV/VCR stand,
|triggering of the record mode can be via wire. If it's placed
elsewhere in
|the room, triggering would be have to be done via RF or other link.
Any
|sensing circuit must be unobtrusive; the thief will be unplugging the
|power cord from a standard extension cord into which the TV is also
|plugged, and so there can't be any suspicious circuitry between the
VCR
|plug and the extension cord...
|
|2) Triggering the record function on an old Sony CCD-V9, 8mm
camcorder:
|how can the camcorder be put in record mode automatically?

```
|
|Any suggestions would be greatly appreciated.
|
|Sorry for the modified return address, but I hate getting spammed.

Consider carefully what you're trying to do.
A Rich man's spectrum analyzer with a very accurate counter
and a tracking generator is BARELY adequate to tune
3-cavity duplexers.

Consider the frequency stability and IF bandwidth required to look
at modulation or close-in spurs.

Will you be looking at small signals in the presence of large ones?
A HUGE (spurious free) dynamic range is critical.

If all you want to do is see if there's a big signal leaking out,
you might get some help from a cheapo analyzer,
if it tunes the harmonic range, if you can trust the calibration.
and it doesn't take three different boxes all cabled together.

There are reasons that a decent spectrum analyzer is EXPENSIVE.

Try to borrow one to verify it does what you need.

As I said in the original post, I don't want to go the alarm route. We can scare off the individual, but, as I said, we want to catch him/her on video.

Any suggestions as to how to do this will be greatly appreciated.

There is a sensor called "Videotector motion detector"
Here's what it say about it

"Attach the sensor on the video monitor. Any
movement in the picture triggers audible alarm
and contact closure. Use the contact closure to
start a VCR or trigger an external security system.
Adjustable sensitivity and alarm volume."

I think this could work, get a picture of
the VCR on the monitor, place the
sensor over that spot.
As soon as some one walks up to the
vcr, you are recording it.

Minus side - expensive - $100
from Home Automation Systems
800-762-7846

disclaimer - I don't work for them, just buy stuff from them.
Some people can get so flame happy.

I was wondering if anybody could refer me to a good web source on the design of antennas? I don't want to buy one because, well, I don't want to spend that much and I feel I could learn more by doing. What is a yagi, a dipole? that kind of stuff. How do you design the length, what is a groundplane good for. Most of the antennas I want to build will be receive only, in the 27MHZ, 49MHZ, 160MHZ and 412MHZ areas, all seperate. Any pointers? Thanks in advance for any info, including any info given here. TTYL

Install a security alarm door reed switch under the vcr and glue the
operating magnet to the VCR base.
>
>2) Triggering the record function on an old Sony CCD-V9, 8mm camcorder:
>how can the camcorder be put in record mode automatically?

If it's an old one you could just solder a small relay contact across
the record button, as long as continuosly pushing "record" doesn't
affect the recording; if it does, use a pulse circuit to drive the
relay.
If the camcorder has an IR remote control, or you can attach it to an
old vcr which does, you could wire up the remote control handset as
above and conceal it in the VCR stand where the camera vcr can "see"
it.

Alternatively, for a completely self contained solution; build the
remote control into the casing of the VCR which is liable to be
stolen, along with a small battery powered circuit which is activated
by a tilt switch and continuously activates "record" on the remote as
above.
If the security vcr is concealed in a suitable place with a good view
of the room, there is a pretty good chance the theif will
inadvertantly "point" the remote at the security vcr on his way out.

Not according to a steel tape measure I've just found, that has those
French units as well as real ones...

5.5 "cms" is roughly 2.25". Your 1.58" is about 4 "cms".

Forget those cheap foreign measuring units and stick with the real thing
:-)

I've been playing with the 24 GHz units from http://www.shfmicro.com for
awhile now; they're pretty nice 5mW units that include varactors for
modulation, which the subway units probably wouldn't. They sell them
for $58 each, which didn't strike me as unreasonably expensive.

I will probably end up not needing the two that I have, as a matter of
fact, because I am likely to need another 10 dB or so worth of ERP in
the project I'm working on. If you're just looking for a couple of
units to play with, I could probably be persuaded to sell 'em cheap.

Additionally, a "rich man's spectrum analyzer" doesn't cost that much these days. You could probably find an HP141T/8554B/8444A for less than $1200 or so without much effort. Hard to see spending money on one of those CATV-tuner jobs unless you're just looking for a fun construction project.

I think Wes Hayward has a good set of plans for a better-than-usual homebrew analyzer on his web site; I forget the address but you could probably look up W7ZOI on the various search engines and find it.

Laura Halliday VA3LDH replied to Greg Flynn:

> > Does anyone know a good cheap source for these components? ... K and X band

> Swap meets.

Yup. I found one table at last weekend's swap meet with
non-adjustable "radar detector testers" -- 10G diode/horn assemblies
with two capacitors and a cigar-lighter plug -- for $5, and another
table with tunable X-band Gunn modules for $10 (same as the above,
except without the plug and with a tuning screw in the cavity -- and
with a QST reprint on how to use 'em). Also found reasonable prices
on X-band waveguide and N-connector coax components, including a
load isolator.

Test equipment to tune it up is the hard part ... had to fork over
something apporaching real money for an 8-12G wavemeter (calibrated
tuned trap on a waveguide, looks like a whole-house water filter!)
last year, but haven't seen enough of these around to let it go.

Once I get my bench clear -- major project in itself -- using it to
tune 'em up will be my project ... and getting my 2m IF rig to work in
it's advertised SSB, CW, and WFM modes in addition to it's AOK NFM
mode. Anyone else in EMA looking to have X-band/10G for the summer?

Thanks for the good idea.

But the room will be used by others, and the VCR will be used, probably.
Only when it is being unplugged, or picked up do I want to record the
video picture of who's doing the unplugging or picking up.

Any other creative suggestions?

Thanks,
Dave

There was a similar thread within the last year...the solution was an
electrical shock setup, resulting in a volume of human urine on the
floor ...I thought it was funny at the time...

Check out www.prescientsys.com . They have a piece of software called
GOTCHA! that I've been looking at. It uses a computer with a video capture
device and camera. Stores the images on your hard drive. Only captures
images when there is movement. Sounds like it would work. Cost might be a
problem but f you could find people to lend you the parts (this sounds like
the problem will be solved once the thief is caught) you might be able to
get away with just the cost of the software. I don't remember what it
costs but I'm pretty sure it was under $80.00.

why do you want to deal with Gunn elements ? have you ever considered
building a DRO utilizing HEMT,S ? its cheaper and much more reliable, i build
24GHZ DRO utilizing 1 hemt with 13dBm output power at 5V Supply and the costs
including PCB are running around 20$.

Good idea on the reed switch but be careful when putting magnets near magnetic sensitive tapes as in VCR tapes find another method. Also check with an electronics supplier for level switches or contact switches such as in what is used on window alarm systems which are not magnetic. There are contact switches which will activate when they are not in contact with a surface or vice versa, usually a tiny plunger style device.

There are some web pages on antennas, but they are mostly fluff. What you need to do is get some books, a pencil, and a paper pad and study a while. Go to the library and check out some books. If you want to start building right away, try the arrl antenna book. After you have looked at some books, go ahead and buy one that you think will be a good reference.

Good luck

Don

Well, I do have info on them, but you're asking for someone else to do an awful lot of typing (or scanning or whatever). You can come over and look at my books if you'd like...this is just the sort of reason I keep old (ancient?) data books around. The first Motorola transistor data books had a wonderful listing of all the JEDEC-registered 1N and 2N numbers.

Seriously, though, at least spend some time looking at the National Semi and Motorola web sites, and maybe one or two others. You should be able to find many of the more modern ones there. Certainly so with the 2N2222, 2905A and 2907.

The sonolert tone could be used to trigger the camcorder, hower.
Just use a electret mic element and a 567 tone decoder at the
camcorder to trigger it. You'll get pictures of your thief fleeing.

You're much better off picking up a real dip meter like the
Measurments model 59. I have the coil set and it makes for the least
sensitive dip meter I have seen- the Measurements being the very best by
far. If still interested, you can have the coil set for 1/2 of whatevere
MFJ sells them for- like new.

It sounds like you have the answer for how to trigger the event covered.
The next step is using that trigger to start the camcorder for it's role
in the process. One possiblility is that if you place the camcorder in
record mode and then remove power it will retain that state when power
is restored. Only you can determine if this is possible. It may reset
itself to another state at power up or it may not. If it does remain in
record mode your questions are pretty much answered.
The device used as the trigger makes and breaks the power to the camcorder.
When the vcr is picked up power is restored to the camcorder and your
recording begins. It stays on until you run out of tape or come along and
find your vcr gone again and the system activated before the tape runs out.

If the camcorder loses it's record state when power is removed I can think
of no other possible suggestions at this time. If I had the unit here to play
with that would be another story but you have been just informative enough to
raise an interest but not enough to provide all of the solutions.

HeHeHe.. Don't worry, it really takes more effor than you think to affect a VCR or tape with a magnet. Just don't use a disk drive magnet! Reed switches are fairly sensistive.

Stuck on the bottom of the vcr it's extremely unlikely to affect
anything. Obviously best kept as far away from the transport as
possible.

Your best bet, and least expensive, would be a Dipole or Groundplane
antenna. The dipole is the least expensive and easiest to build and is
relativley directional while a groundplane is omni-directional.

What you are trying to receive at these frequencies would really
determine what type of antenna you should build. Let me know and I
will send you some information and a few URL's that you can go to.

2063. RX-320 Free Software

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-20 00:00:00 UTC
From: mktg@ix.netcom.com
Message-ID: <36d10f8a.14829925@nntp.ix.netcom.com>
Source record: 73341

February 20, 1999

Dear RX-320 User,

Beta Version 1.0B is now available for the software I
wrote to operate the Ten-Tec RX-320 receiver.

Changes from Version 1.0A:
- Program displays a list of scan files for you
to make a selection. It is no longer necessary
to type the name of a scan file
- AGC setting now works correctly.
- The setting of the Offset is saved between
sessions.
- The program code has been fine tuned to increase
efficiency and speed.

Features of Version 1.0B:

- Squelch (adjustable)
- Scanning of lists (files) with adjustable delay
- Tuning in a variety of steps from 1 Hz to 1 Mhz
- 34 selectivity settings
- Runs under DOS or Windows - even works on a 80386
computer using DOS

I would be happy to supply free of charge this Beta version
to anyone interested who has an RX-320. The software will not
function without an RX-320.

The program is supplied along with several other files in
a single zip file. Installation and removal are simple, as
the program does not affect any system settings either in
DOS or windows.

The program is easy to use - just press various keys to engage
the different functions.

Istallation, removal, and operating instructions are included.

If there is enough interest, the Beta version may advance into
a final version.

Send your request to my e-mail at mktg@ix.netcom.com and I will
send you the zip file by return e-mail.

Regards,

David

Some years ago we had a similar problem with office equipment
disappearing. In our case, since there was a building watchman on
duty, we triggered an alarm; but the idea we used might be applicable
in your situation as well.

I don't remember the circuit details, but it was basically a solid
state relay triggered by breaking a fine wire loop which was attached
to the bottoms of the equipment. The wire came from an old audio
transformer, probably No.40AWG, maybe smaller, and was practically
invisible. In one area we daisy-chained it under two IBM Selectrics.

You couldn't even feel the wire pull and break when you moved the
equipment, as one of the secretaries found out when she forgot the
wire and decided it was time to dust underneath :-). And yes, the guy
was caught.

Provided the thief is slow. Many camcorders and VCRs take a *long*
time to go from stop to record, long enough to entirely miss a thief
who's in a hurry.

Another possibility: run the camera output to a frame grabber on a PC
hidden somewhere. Grab and store a frame every 5 or 10 seconds. Have
enough disk space for maybe 5 minutes of total images. As each new
image is grabbed, delete the oldest of the existing ones to keep the
space used the same.

Then, when the alarm goes off, you can save images from 5 minutes *before*
the alarm, as well as for some time after.

> feed this monster?
>
> Tim ka8ddz

Tim,

The J-Pole is just a half wave antenna feed at the end MATCHED with a
quarter wave line.
(The short side is half of the 1/4 wave matching section.)
At the top of the stub is almost infinite impedance, just like feeding the
end of a half wave.
At the bottom (They are almost ALL shorted) it is zero impedance.
Somewhere along the line is 50 ohms or 200 ohms or 300 ohms or whatever you
require.
This is a balanced matching section so where you attach the inner to outer
conductors of the
coax makes no difference.
So if you are using 50 ohm coax and you find the 50 ohm point on the
matching section,
you only need a 1:1 balun. I prefer the choke balun. I don't usually use
coiled coax,
but rather a few ferries of the right type for the frequency involved on the
coax at the
feed point. The balun does NOTHING to match the antenna.
Use hose clamps to attach the two conductors of you choked coax to the
matching section.
(The "J") You can then slide it up and down the matching section to find
the best match.
Mark the spot, take off the clamps, solder the coax conductors to the spots
you marked.
(I actually make copper straps wide enough to hold a coax flange connector
and an equally
wide piece to the center conductor of the connector.)

Questions?

mark the equipment. a spot of krylon on the bottom would do for a start.
(don't get too carried away - spray paint could get inside the machine and
mess it up.

check your local pawn shops.

usually the crooks don't want the VTR, the want the money the VTR represents
for drugs or whatever.

Hi...

I'm cleaning house. I'd like to sell out some of my satellite books.
I have the following books for sale. (Sorry, I don't want to separate
them....buy them all, one price.)

ARRL The Satellite Experimenter's Handbook
by Martin Davidoff K2UBC
Retail: $20

The ARRL Satellite Anthology (2nd Edition)
The Best of Recent QST articles on amateur satellite operation and hardware
Retail: $8

ARRL Weather Satellite Handbook (Fourth Edition)
by Dr. Ralph E. Taggart, WB8DQT
Retail: $20

The Amateur Radio Astronomer's Handbook
(Build your own radio telescope!)
Retail: $19.95

I'm asking $25 for the whole package (plus $5 shipping).

If interested, please send email to the address listed in
the signature below, and we can swap address particulars,
or I can answer any other questions you might have.

Thanks...

Ken, N1NEG

Hello--
I recall that Anzac is a trademark or a division of Adams-Russell Corp.
which is (or was) located in Waltham, MA. I may have an old catalog,
but I'm not sure where it's located as of now.

Drop me an e-mail message if you can't locate a website for A-R, and
I'll go digging.

The FM-104 is a broadband passive frequency doubler.

It's input frequency range is 75 - 1500 MHz

Output 150 - 3000 MHz

Conversion loss about 13 dB

Since it's a variation on a diode mixer, it needs an input of around +10 dBm

As far as I can tell from the catalog, the input and output pins are marked.

2082. Re: How to wind a coil?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-21 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01be5df0$ac49bb40$LocalHost@default>
Source record: 73127

No kidding.

Silver is good. It looks nice especially when laid out on the rich man's table, but takes a lot of elbow grease to keep it that way. Ask the housemaid. It has some desirable mechanical properties. Its softness assists with making good electrical contacts so fine for plating roller inductors. It easily electroplates. It is expensive. Men have killed for it !

But its DC electrical conductuctivity is only 6% better than copper. At HF, because current flows on a thin skin, silver plated copper wire has a resistance only 3% lower than copper. It is not worth the cost of the plating operation plus the cost of the silver.

Important :- To be fully effective the plating has to be quite thick - at least twice the thickness of the RF skin depth in silver. At 1 MHz plating thickness should be at least 0.006 inches. At 100 MHz, 1/10 of this will suffice.

There's another effect - oxides of silver are semiconductors, ie of intermediate resistance values. When the wire is tarnished the current flows in the tarnish and RF loss can be greater than with copper. But all very uncertain.

Copper oxides have a very high resistance. So a tarnished copper wire behaves as an insulated copper wire and retains the low resistance of untarnished copper.

I think skin effect is marvellous. It makes the calculation of HF resistance of copper wire easy. It is R = Sqrt (F) / 12 / d ohms per metre, where F is in MHz and d is diameter in millimetres. Silver wire, as discussed above, is 3% less.

Tinned copper wire has an RF resistance 2.6 times greater than bare copper. Keeps looking nice and very easy to solder but terrible stuff for tuning coils. Shun it as you would 1 KW electric fire radiator elements.

Gold plated copper wire has an HF resistance 19% greater than bare copper. A balanced-to-unbalanced ATU using gold plated coils with swinging links, built inside a glass case, is something to be proudly displayed to visitors. Many amateurs would consider the prestige attached to a

gold plated ATU to be well worth the penalty of about 5% of
an S-unit in transmitted signals.

Trouble-making Housing Association neighbors might also be
suitably impressed.

Afraid you're stuck with it, the 8405 will go somewhat past the limits of the filter switch with a big signal, but isn't guaranteed out there.
You could auto step it with a Ledex switch or stepper motor if you need to go past those limits, better to just get out the network analyzer.

Hi,

I'm looking for the frequency range knob of the modulation generator (option
001) of a HP8640A Signal Generator.

Another beige-coloured HP knob of the 70's (for 0.25 in axis, bottom diam.
0.6 in,
length 0.6 in, suited for a second coaxial axis) would also do.

Any idea?

Peter

Hi Tim. You are very right in asking matching questions regarding the J pole antenna. There is quite a bit of misinformation on matching, even in the ARRL antenna handbook. That is: Do NOT tap both the shield and the center conductor up the side of the quarter wave stub!
This is guaranteed to produce feedline radiation.
Do ground the coax shield at the base of the J quarter wave section halfwave between the two vertical members and extend the center coaxial conductor between the vertical portions. Experiments in the past indicate that either the short or the radiator portion can be tapped. Usually the "tap" is a short length of solid insulated house wire wrapped several times around the antenna conductor forming a capacitor. There is no need for a balun of any kind as this very procedure is an excellent balun.
For 6 meters, you might make the housewire portion about 13 inches long and wrap about 13 turns around the matching section. Do not be afraid to apply "trial and error" as all that can be lost is is a few inches of house wire! Keep an eye on the VSWR bridge and simply play!
For two meters, the dimensions are: Up five inches with house wire and about five to seven turns around the J radiator. The proper number of turns depends primarily on the antenna diameter, not the house wire size.
Two points to be gained here, 1) Ground the coax shield at the very bottom of the J----do not tap up! and 2) Play with dimensions of house wire while observing a VSWR bridge. 73 Cliff K7RR/W6HDO

I represent a Madison-based internet company specializing in high quality streaming audio and video content. Our most recent success has been a website focusing on helping the careers unsigned bands and artists from around the world. In fact, it's been such a success that our staff is being overwhelmed by the incoming content.

We're looking to gain the support of our local community businesses. In

exchange for your support, we are offering prime-time commercial spots as well as targeted banner advertising.

Our website, http://www.UnsignedRadio.com/, has between 250,000 and 500,000 page hits per month. Because a significant amount of our traffic is local, there is a great potential to gain a strong customer base from such advertising.

If you're interested in finding out more about how both of our businesses can benefit from something like this, please call me at 608.277.0635 or 888.829.2988 at your convenience. Thank you for your time.

Sincerely,
Dan Chosy

My .002 Euro here :*)

Use an old pc (486 or so) to grab images with a
b/w Quickcam that connects to the parallel port;
IIRC, on the net there are free programs/sources/drivers
to do that job under Linux (free itself too).
Then there are two solutions:

1- Write a dumb program that grabs images at a reasonable
rate (eg: one each 5 seconds), saves them on the hard
disk, keeping the last 24 hour ones.
Simple, but you'll need a big hard disk.

2- Write a smart program that grabs images faster, compares
them (eg: if image221.xyz != image220.xyz, then the camera
is seeing something) then saves only the ones that
differ, and delete the others.
By image "different" from another I mean dark/light
differences, you won't need image recognition for
that purpose.
Just make sure there are no cats/dogs in the room!:)

In that way you could also make the computer dial at
your (or police's) phone number with a prerecorded
voice that warns about the theft in act.
No alarm would scream, so the thief could be catched.

PS. By removing the IR filter, those cameras become
sensitive to the infrared too. Some IR "lamps" could
make the whole thing work also in a dark environment.

I've just recently put up a 6m Jpole, I've looked in the handbook and an old antenna handbook for feeding options. I don't understand the difference between a transforming 4:1 balun and a choke balun. Are they the same? Someone said you could feed the jpole by coiling up 10ft or so of cable at a specific diameter to create a choke balun, while I understand the purpose is to keep the coax from radiating how does this match? I was under the impression a Jpole that is shorted at the bottom has an impedance close to 200 ohms requiring a 4:1 transformer, others said connect the coax directly to the Jpole but the hot side goes to the shorter stub. I'm completly confused can anyone tell me the best way to feed this monster?

```
in |-----------| out
+ IN v dc >--------------------| 7805 vreg |-------o
| | |
----------- Rx
---------- | |
0V >-0 - | 9v bat | + o------o-------------0
----------
```

IN v is >= 1.5v * (number of cells in battery pack) + 5v
Rx = 5v / charge current eg. 100mA charge 5v / 0.10mA = 50 ohm
watt rating of Rx = 5v * charge current 5v * 0.10mA = 0.5W so use 1W
The voltage reg should run cool at the pp3 charge rate, so no need for
heatsinking it.
I use this cct to charge 4Ah 'C' cells at their 14h rate with a small
heatsink on the Vreg. if

cheers..

I want to build a couple 4 channel cassette player/recorders using
autoreverse tape heads, now here are the questions:
1.What is the impedance of the typical head?
2.What level of audio voltage will be required to record?
3.How much gain will I need for playback (to drive line-level inputs)?
4.Where can I find inexpensive autoreverse tapeheads?
5.What is the frequency reponse of a typical head at normal speed?
6.What hampers the low frequency response?
7.Would it be possible to gang 2 of these beasts without a noticable
delay?
tnx,
matt

I picked up an old RADIO SHACK TRC-201 Hand held CB 2 watt 3 channel radio.

It uses three crystals in the receiver and three in the transmitter. The crystals are very small (like the size of your smallest fingernail) and correspond to the three channels.

Any ideas on how to convert this thing to ten meter AM?

What kinds of crystals were they using in these rigs? Third Overtone?

Thanks, 73 Bill N2CQR

I don't have it, but this is a 30 year old type, not particular
interesting for any design, you may compare it to MPF102 or MPF106. If
you need it for a specific application you may need pinch off voltage,
but normally one don't

Mnay thanks Jim. I have a dozen of them I received from another ham several years ago. Gold plated, I didn't want to throw them away, but with those conversion losses, and what I can get from an MCL, think I may!

Yea, I don't know anyone who likes Spam, it must sell tho, so many SOB's are doing it. Unfortunately, AOL doesn't let me use an acronym for an address and I get plenty. Looking for a good ISP is something like looking for an ANZAC homepage.

Thanks again

I've obtained HP vector-voltmeter(model HP8405A) recently, and I'm planning to display the
amplitude-phase response of filters automatically combined with sweep generator.

One of the problem I realized is the narrow tuning range of vector-voltmeter(about 1 octave).
If anyone know the way to overcome, please let me know.
I don't like to use the network analyzer, because it's difficult to borrow and too expensive to buy.

How deep are your pockets? Metcal makes some good ones, and actually has one in the $200 region, I think. I'm still using a Weller WTCP station I bought surplus for $10 or so over 20 years ago, and I've snagged a couple more newer ones for $5 or so each. With the right tip (I can't remember the number...long and very fine point), it works fine for 0.05" lead spacing SOIC packs and R's and C's and L's in standard SMT packages, at least down to 0603. I can do fine pitch with it if I'm careful. And there are those who will recommend a little butane torch (e.g., Weller Pyropen I think it is). You put down some solder paste, place the part, and heat. The surface tension of the solder tends to pull the SMT part into place, provided the pads on the board are the right sizes and you've used the right amount of solder paste. I personally perfer the iron, but that's the thing: some of soldering is personal technique and preference.

Unless I am very wrong: the BF255 is an NPN BJT transistor with f_T=200MHz.
Pinchoff voltage is only defined for FETs.

I tried searching at the Siemens website as Carl R. Stevenson
suggested, but no luck. The lowest number I found there was
BF4andsomething :)

But you are probably right that it is an old type.

2120. Point Contact Transistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-22 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <36d1878e.7416303@news.erols.com>
Source record: 73150

We were talking a while bak about homebrew transistors. I came across an interesting description of them in an old Navy publication (NAVPERS 10087-B) on Basic electronics. "During the manufacturing process of the point contact diode, a relatively large current is passed from the catwhisker (beryllium copper, phosphor bronze or tungsten wire) to the (n-type) germanium crystal. The result of this large current is the formation of a small P type region in the vicinity of the point contact."

Does anybody know HOW the current causes the N- type material to "go P"? Also, how is the junction formed in ordinary galena, catwhisker detectors (where no large current was employed)?

Thanks, 73 Bill N2CQR

10m conversion on your handheld CB would be simple:
- Order crystals for the desired operating frequencies from JAN or International (just tell them what kind of CB it is; they should have the tech info on it in their files);
- plug the crystals in;
- tweak up the transmitter coils for maximum output, starting with the oscillator and working toward the PA;
- tweak up the receiver front end coils for maximum received signal strength (the i-f coils shouldn't need much tweaking).
That's it.

More than likely, if your tower is 60 feet or higher, with a yagi on top,
your resonant frequency will be somewhere in the broadcast band.
You will need a Millen GDO with the low freq. coil to dip it with.

GL!

2125. How to test an RF choke? (RF amp, plate-supply)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-22 00:00:00 UTC
From: Joel Govostes <jgovost1@twcny.rr.com>
Message-ID: <36D180AA.1DC40C8A@twcny.rr.com>
Source record: 73155
Cross-posted to: sci.electronics.basics,rec.radio.amateur.homebrew

The RF choke in an RF-amp's plate supply acts to prevent
short-circuiting the pwr supply with RF --
(according to texts).

But -- if such a choke were to overheat, short in the windings, or
otherwise go bad, what symptoms would arise? How might it affect
tuning-up of the amp, and is there a good simple way to check for
quality, & to make sure a choke (from an older piece of gear) is
useable / has not been damaged?

The choke in question is 500uh, in the 300v plate supply of a small VHF
(rf) tube amplifier.

Any info would be greatly appreciated...

thanks,
JWG

Really ? I got some silver plated B&W Aridux coils, small ones
I think 3/4 to 1 inch in diameter. I cannnot remember where I got
them from. I would guess whover originally had them plated them
himself as I do no remember B&W selling silver plated Airdux coil
stock.

Hi,

I have the following high voltage disc ceramic caps.
for sale.

6 of 180pf at 6kv
16 of 470pf at 3kv
24 of 180pf at 3kv
16 1000pf at 2kv

Make offer. These are pcb mount compoments with 3/4 to 1 inch
leads.

>P"?

Don't know about this, but....

>Also, how is the junction formed in ordinary galena, catwhisker
>detectors (where no large current was employed)?

This is because in natural semiconductors there are natural impurities.
These impurities are similar to the doping in manufactured semiconductors,
and cause regions of N and P, as well as 'intrinsic' (pure material).

When you move around the catwhisker your are looking for one of these N or P
areas on the surface. As posted previously (a week or 2 ago) it is
theoretically possible to form a transistor in this manner using 2
catwhiskers (besides the normal mounting).

Has anyone out there actually tried this? I would like to hear how it
worked.

Ya, when there are SEVERAL progs to do exactly that in Windows...?
There's even one (atleast) like you mentioned (what genius.....) that only
records the images when something changes.. It can even tell the difference
between an object moving and the sun changing positions (to alter shadows).
You can find the progs at www.windows95.com (it'll redirect you to the
proper address, since they stopped using that one for obvious reasons)...

I am hoping to use a spare thruline (no meter) as a PEP type instrument.
Has anyone measured the scale law for the 30uA meter (even better - produced
a
scale for a standard meter so I don't need to bother with making a new
design).

The analogue meter scale is rather compact at one end and it might not be a
bad idea to try and erctify this while I am at it. I am thinking of
something along
the lines of a 16C71 driving the meter via a lookup table.

>quieter.

A VCR left in "pause" generally has the tape threaded, the video head spinning, and is all ready to start recording when the capstan starts rotating. Going from pause to record takes a fraction of a second.

Unfortunately, if you leave a VCR like this for more than a few minutes, the head will wear the oxide right off the tape. It's spinning at 1800 RPM, and rubbing the same narrow track on the tape twice per revolution, so the tape gets 3600 "passes" of wear per minute of waiting time.

To protect the tape, most VCRs will not remain in pause for very long. Maybe they'll spin down the head, or unload the tape - but whatever they do it will drastically increase the amount of time required to get into "record" once the signal is given.

Hello, Glenn--

I found three odometer-style mechanical "counters" in my collection. These are unused, NOS but not in original wrappings. All read 000-999, with no decimal points.

All are manufactured by Durant (Watertown, WI).

All measure 1.4 inches long by 1.1 inches deep by 0.8 inches wide (across viewing face). All mount via the rear surface via two 4-40 tapped holes on 0.625-inch centers. Each has a 0.156-inch dia. shaft that's 0.5 inches long. All have 0.2-inch high digits.

One carries p/n 3-Y-41181-406-R-CL; this one has an aluminum frame, and when you're looking at the digits its shaft exits to the right.

Two carry p/n 3-Y-41700-421-L-CL; these have a black plastic frame, and when you're looking at their digits their shafts exit to the left.

I can e-mail you a bitmapped image (from an HP scanner) showing you all three; there are a few scan artifacts in the image, but it'll give you a general idea of their shape.

If you're interested, you can purchase all three for $9.00 plus $4.00 priority-mail postage. You can, of course return these for a refund if they're not satisfactory.

Dear Newsgroup,

I am designing a HF Transceiver. It possibly will use a
Motorola 68000 or a Intel 80x86 processor (have not decided which one), and
possiblty the Texas instruments DSP Processor. It will have most of the HF
bands; i.e. 20m, 40m, 80m,etc. It will have an LCD Display and a beautiful
custom chassis by:

Spire Audio Http://www.spireaudio.com
Http://www.spireaudio.com/products.html

Chassis will be 6" high x 17" (from left side to right side) x 10" (from
front panel to rear panel)

* will have 4 pin mic connector and 8 pin mic connector

Please make suggestions to gbowne@email.msn.com

Gregory Bowne
Seattle,WA

P.S. Soon after I finish the transceiver I will get my liscence! I am
still studying for it... Been on 2m with a friend using a Kenwood TR-7400A.

> May be interested in equipment to do this, if you have a solution.

> Suggestions are welcome.

The scanner that I used for my doigital photo class was made by Kodak, but there are similar ones made by Nikon and others. This is a scanner that has a plastic holder for either slides or negatives, and each slide or negative has to be positioned by hand in the holder. If you are serious about doing this, I would think that this type of machine would be too slow and labor intensive. The machine itself costs maybe 10 thousand dollars. And that was the low priced model; there are drum scanners that are up to 25 thousand.

You can use some other method, but I don't think that the resolution would be adequate. The Kodak can scan at 2000 PPI (pixels per inch). Since the slide is about an inch, blowing it up to 11 inches would bring the resolution down to about 200 to 300 PPI, which is about what you need for decent resolution.

The reason I mention this is because the stuff you're doing will need to be at least this good. With a flat bed scanner and transparency adapter, I don't think you're going to get good enough resolution to get a decent image. But you could try it. Go to a photo service bureau and pay them to scan your microfiche in with a flat bed, and see if it's good enough for your purposes. That way, if you're going to try it, you don't have to shell out for the whole scanner. You may also be able to get them to scan the microfiche in with the Kodak or other machines, too.

You might be able to get them to put the fiches on CD-ROM for you, too. Good luck.

>I am looking at a 2m DCI filter to clean this up, and was
>wondering if anyone here has any homebrew ideas to build
>such a device.

The DCI filter is made up of 4 helical resonators. They are large
in order to get low loss and low SWR so you can transmit through it
(I think it's rated at 200 W). If you only want filtration on receive,
you could use something much smaller - but then you'd have to figure
out how to bypass it on transmit. There are commercial filters
that do exactly this.

I haven't seen anything in ARRL publications about building helical
filters, but the RSGB publications are somewhat better. The RSGB
"Radio Communication Handbook" talks about helical filters in general
terms in section 8.6. The "VHF/UHF Manual" has a short section on
designing and building a helical filter starting on page 3.7.

These references might be a good place to start if you want the
experience of building and aligning a filter yourself. On the other
hand, if you just want to get rid of the interference, the DCI filter
is not that expensive, it's well built, and it's already tuned - buying
it will save you a lot of time.

Not a flame, but these are fairly poor choices for CPU's if you want to keep your part count down. There are some 80486 style of computers on a single chip which would probably be better suited.

Personally, I would use PIC's for control purposes.

Regards

Christopher Cox

10 turns no 32 on ft37 wound trifiliar should be fine

K7HFD low noise high output(+17dbm) 2- 2n3904 long tailed pair transistor
oscilator should work fine, It worked fine for me.
Design and shield that LC tuned circuit properly.
Drawback : needs mechanical tuning cap due to high power levels

Otherwise, if U need VCO, the most commonly used circuit is the
FET dueal Varactor colpitts VCO, followed by a 2 transistor buffer
to raise the power level.

Look at the ARRL HB for 1995 page 14.18 and 14.36 for further info.

I would not use such a microprocessor in this case.

Right now I am homebrewing a 80 meter transciever, and planning to use a
16F84 PIC controller for display readout.

Other good rasons to use a PIC controller is that a "burner" is very easy to
make, and that the design by using a PCI controller is very simple.
If you want to use a 80x86 CPU you will need a lot of extra components, such
as external RAM & ROM, chip select, wait state generator ect.

Looking for a Neophyte 40m receiver that you've built and no longer want, or a kit for one you haven't built. I know that Dan's small parts has a kit for a little over $18, but it occurs to me that there are some used ones out there that no one is using. Want one to mess with and modify...cheap. Let me know whether yours works, and how much shipped to me in Texas...

Sorry it took so long to respond.

xxx@yyy.com wrote:
: Why 5.2075 IF ?

Actually, it's 5.20175 -- sorry for the typo. The reason is that I received some boss-keen 10-pole monolithic filters at this frequency from a wealthy benefactor. These have been tested to have extremely high 3OIP and low IL. The plan under development, which I am greedily copying, is to use them as hybrid roofing filters.

: What are the design specs of the filter (extraordinary CW filter) ???

At the time I posted my original note, I was thinking of building an extraordinary CW filter. Subsequently I have quit dreaming and have decided on an SSB filter which won't, of course, require such high-Q crystals to realize decent insertion loss.

: What design are u using for the filter ??

I'm using W7ZOI's 'X' software to compute coupling cap values for Chebychev ladder filters. This is my first whack at this sort of thing; I'm getting a lot of guidance from my benefactors.

: What about the assymmetrical bandpass characteristics of a cascaded
: ladder filter with so many poles.

It's a nuisance, isn't it?

: QQQ : Why shouldnt we just convert to a IF of 15 KHZ from 455Khz ,
: and just use one of the powerful DSP processors EVM to implement
: whatever filter you desire. DSP filters have better passband/stopband
: characteristics, and ring much less. Plus, they can are very flexible .

There are many viable approaches to radio design. I'm just keen on the traditional method for the moment.

Anyway, the nice folks at International Crystal are helping me out and I'm just going to buy a set of rocks from them.

Thanks for the comments.

-Henry

Hello (OM?),

Your questions are best answered by your own study of literature, of which there
is a large amount available. Try any of the ARRL antenna books. I agree with
you that building an antenna is by far the most cost-effective, not to mention
educational, way to obtain an antenna.

Source record: 73190

Richard Karlquist (rick@area.com) wrote:
: I would shop around and see what you can get from other vendors
: at 10 MHz. You might get higher Q for less $$$.

You'd be surprised. CCC is the only vendor I've been able to dig up that can do better than about Q=150,000. I get the feeling that applications for super-duper crystal filters, and hence the supply of raw parts, are drying up. DSP is cheaper.

I have a DSP56002EVM. One of these days I might play with it, but for the moment I'm interested in getting more experience with old-fashioned RF circuits.

I don't have a radio at the moment. In fact, I just got my license. I figured if I was going to build a rig, I ought to take my time and build a really good one...

> that do exactly this.

There is a line of helical filter modules, I think it was from Toko, in
the big catalogs, Mouser or Digikey, that could be inserted into your
receive-side or TR-switched to suit. But it's not a bad idea to get
one big enough to transmit through, as it provides an extra guarantee
on the purity of YOUR emmissions. I so very much like the helicals
built into my 1970s 2m mobile that I'll probably go this route
myself eventually.

> I haven't seen anything in ARRL publications about building helical
> filters,

I forget which book, but it's in one of the ARRL books too.

> but the RSGB publications are somewhat better.

So I've heard, have to get some ... not having any yet is how I can
be reasonably certain the one I'm remembering was in ARRL.
Probably one of the two ARRL UHF/microwave books.

So a PIC-chip and a calculator case and you've got a remote control.
The PIC's probably even prefer to operate at TTL on their supposed
serial lines same as the radios. Someone should do a PIC-QSYer as a
project article. (See Hagman's articles in Feb and March 99 QST
for use of PICs in radio projects if this is gibberish.)

Oh wait, this is the .equipment group, I should be saying this in
homebrew ... well, consider it a product idea :-)

I have been informed (in a less than polite way) that I was too broad in my statement that I had listed my Henry 2KD5 in this or any other newsgroup and that I had been defrauded by somenon who was using the newsgroups. That was not my intention. My only intention was to warn all of you about this individual in case you might have the occasion to have dealings with him. I never expect to see a dime of my loss again so I had not hoped to gain in any way by my posting to the newsgroups.

So let me be perfectly clear -I DID NOT POST MY HENRY 2KD5 IN THIS OR ANY OTHER NEWSGROUP. I WAS NOT DEFRAUDED BY ANYONE THROUGH THESE NEWSGROUPS.

My ads were all at Internet trading sites and all of them have been informed of the situation, as well as this person's ISP and all law enforcement officials in the respective jurisdictions.

I have slit my wrist and let a small sampling of blood fall on my keyboard in pennance.

Regards,

Gary

I don't really need to worry about the part count. Personally I like the idea of using a full microprocessor. I have an STL from an FM radio station that uses a 486dx25 chip. I was really thinking about using what I had on hand, which was a Motorola 680000 10MHz, or a 386DX 25MHz. Dunno how much RAM I would need, but I would like about 1 to 4MB.
BASIC Stamps, Microcontrollers, Microprocessors, PIC's, etc.

> difference between a transforming 4:1 balun and a choke balun. Are they
> the same?

They refer to different properties. There are two fundamentally different types of baluns. One, called a "choke" or "current" balun, forces the currents in the two conductors to be equal and opposite. The other, a "voltage" balun, forces equal and opposite voltages on the two conductors. Either type can be made to perform impedance transformation such as 4:1. See the _ARRL Handbook_ for a brief explanation, and "Baluns: What They Do and How They Do It" in the _ARRL Antenna Compendium_, Vol. 1, for more detail.

> Someone said you could feed the jpole by coiling up 10ft or so
> of cable at a specific diameter to create a choke balun, while I
> understand the purpose is to keep the coax from radiating how does this
> match?

The function of a balun is to keep the feedline from radiating by reducing the common-mode, or "antenna" current on it. In the case of coax, this flows on the outside of the coax. Winding the coax into a coil makes a broadly resonant circuit which performs this choking action. Dimensions which provide the greatest impedance on various bands can be found in the _ARRL Handbook_.

I was under the impression a Jpole that is shorted at the bottom
> has an impedance close to 200 ohms requiring a 4:1 transformer, others
> said connect the coax directly to the Jpole but the hot side goes to the
> shorter stub. I'm completly confused can anyone tell me the best way to
> feed this monster?
>
> Tim ka8ddz

Actually, you can feed a J-pole by just connecting the coax directly to the bottoms of the wires, then adjusting the wire lengths for the best match. Or you can short the bottom wires together and tap up with the coax. No matter how you do it, there will be considerable current on the outside of the coax due to coupling with the radiator. The amount of current depends on the orientation of the coax and its length. Modeling I've done shows that it takes a couple of baluns, one at the feedpoint and another about 1/4 wavelength down, to reduce the current to a low level if it's initially large.

Dear Newsgroup,
A while back I saw somewhere a Motorola AM or FM (cant
remember which) Modulation Monitor for a radio station. It possibly was
made later than 1960. Does anyone know about this unit? It was quite a
lovely looking (asthetically) peice of ecquipment.
The one I saw was at a antique radio society flea market in
the area. If I saw a pictures of one, I could tell you if it matched what I
saw. I would like to build a replica. Motorola is still conducting a
search of its records for me.

Thanx,
Gregory Bowne

This is all well and good but completely trivial compared to the engineering that must go into the RF section of the radio. High speed microprocessors are notorious for generating wideband noise in receivers. But even if it is shielded perfectly, the radio will be a far more complex project. Fancy cases with lots of bells and whistles mean nothing if the radio works poorly.

This does not sound right. RT Systems will upgrade you to their newest version
for twenty bucks - plus minimal charges for shipping. Are you really a
legitimate purchaser of their software?

Heck - I am two Updates behind - and RT Systems is upgrading me to the newest,
VX-5R-compatible ADMS-1E v2.0x version for only twenty bucks.

>Ya, when there are SEVERAL progs to do exactly that in Windows...?

Hmm, I supposed he wanted to make the whole thing himself,
and also I didn't check if there are such progs under
Linux (BSD, etc.) too.

Anyway, besides reliability and overall quality reasons
(don't want to start a stupid OS war), I would choose
Linux *for that purpose* because Linux is free and
well documented.
Windows is not free, wants more resources (cpu, ram, etc.),
you cannot operate it remotely without buying expensive
software, so you'll need a video card and a monitor too.
And, if you plan to write the software yourself you'll
also need documentation and a development system.
Windows lack both natively, Linux have both free.
For example, in every Linux distribution there are also
docs on how to interface external electronic appliances to
I/O ports and how to connect unsupported UPSs.
The kernel is also customizable: one can cut away unneeded
things to fit it into small machines (8088/86-like embedded
processors too, search for "ELKS"). IMO it's worth a look.

And even realizing that Linux is the worst OS in the
world, you haven'wasted any money (ok, a couple of $
for the CD :*).

Not related to the original topic but, since you are an
Old Man, I bet you'll be interested to know that Linux
supports natively the AX-25 packet radio protocol.

73's

PS. I follow only s.e.misc, and occasionally s.e.repair
(among the originally crossposted groups).
Feel free to remove the ones we don't read both, to
limit the noise.

2197. SWR vs impeadance mismatch

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-24 00:00:00 UTC
From: Tim <ka8ddz@eaglequest.com>
Message-ID: <36D46613.845BCEB0@eaglequest.com>
Source record: 73219
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna

Tuning a 6m jpole,&#65533; I move the clamps up and down on the jpole for minimum SWR but I can't get it to drop to 1:1. I am moving the hose clamps up and down to match 50ohms which is my feedline, and I have been told to dip for minumum SWR.

Fine, but now that I have it to a minumum, it wont dip to 1:1 should I now start looking at trimming the antenna? I'm not sure I understand the relationship of matching the feedline by tuning for minumum SWR VS the resonance of the antenna. If the antenna were say an inch too long would changing the feedpoint compensate for this? or do I move the clamps for min SWR THEN trim the antenna for an even better match?

HELP!

Impedance matching always involves two variables - R
and jX. At least two control knobs are required on any
ATU.

On the antenna itself, after adjusting the clamps for
minimum SWR the next move is to adjust the antenna length,
ie, bring it into exact resonance. Then return to the
clamps for an exact 1-to-1 SWR in a sequence similar to
that used on an ATU. Its hard luck if it's necessary to
increase the length of antenna elements. This may arise if
the feeder impedance is not exactly the design value. But
a small residual mismatch will not be noticed by anyone or
anything except your SWR meter. Just don't look at it !

Doesn't anybody out there have a Dentron GLA-1000"B" with the 10M mod?
I'd really like to get the info on the mod, it has to be the "B" model.

How far away is it? Some years ago we had a police transmitter getting into the input of a local repeater. A friend and I drove around and located the signal, and it turned out to be a spur from a transmitter at a PSAP about 8 miles from the repeater. We notified the Chief of Police and he had it fixed... twice (the repairman didn't get it the first time).

Let's not get hung up on details here, Paul... perhaps they plan to
emulate all the RF stuff in software. :-)

Early versions of the VX1R could not be programmed due to a problem with the radio. If you own an earlier version of the software, why not find out the serial number of the radio and give RT Systems a call? If your radio is programmable, RT sells the upgrade for $20.00 as stated in the other message.

I hope you all feel bigger now. I do not chime in unless I have some knowledge to impart. Digital hardware and software is my strong suite. I am impressed with good RF design and usually just monitor groups like this in an attempt to glean knowledge. Nothing like the introduction of a couple hundred thousand transistors in a package the size of your thumb to make a RF Engineer to sit up and cry foul.

Clint you truly are a jerk. Is this last comment necessary? As a matter
of fact RT doesn't care if you register or not what they sell is The
whole business for $39 with the level converter or the latest software
as an upgrade with the 2 to 3 adapter for $20. What really was uncalled
for was the comment about this questioner "really a legitimate
purchaser" what a pompus ass you are Clint.

When I transmit and have my microphone near my keyboard (< 1 ft) the lights on the keyboard flash and letters appear on the computer screen. If it would type what I said, I'd be thrilled, but alas, no such luck.

I've worked on my grounding (I'm on the second floor and ran a larger diameter copper wire down to the ground rod) and tried several chokes on the mike wire, but nothing seems to help.

Anyone know what I might try?

BJT refers to a Bipolar Junction Transistor, i.e., having both N and P type semiconductor material, and having PN-junctions as opposed to a FET which would only have one type of material and no PN junctions.

Bob OM,

You have to isolate the source.
Transmit into a dummy load. Still have the problem?
If so, it is coming directly from the rig. Suggests ferrite loading of AC line on
computer and/or rig.
No problem using dummy load? Radiation from the feedline
or close proximity to the antenna. How far away is your antenna? In/near the house?
Good luck! Reduced power will usually show you the power level at which the problem
occurs. Operate below that level and work on problem, see if you can get an improvement
based on tolerable power level. If using coax feedline, insert a choke balun on the line to
minimize common mode current on outside of line. Run line at low SWR (flat).

73 and GL,

Don, W6JL

You obviously aren't a small business owner, Gerald. I doubt you have ever
successfully marketed anything in your career. No matter.

Why you perceive a problem with someone who just hung up with RT Systems and
discussed this very matter and found out the truth is beyond rational thought.

Work on your inner anger somewhere else, would you please? Your
anti-Clint rantings are in no way in the true spirit of what Amateur Radio is
supposed to be all about. In the mean time, I will continue to support those
firms that treat their public well. And RT Systems treats their valid customer
base with respect and excellent products.

A wild-assed guess: large current causes migration of impurities (e.g.
atoms from catwhisker)
to diffuse into the germanium, forming (note my hands, waving furiously
here) a P-type region.

Don

Thanks for the quick help

I hadn't tried the dummy load test, the newbie that I am, and I only get the problem when connected to the antenna. It takes about 50 watts to get the effect. I would add that I also have a lot of problem with speaker in my shack. The antenna, a dipole is outside, but only about 10 feet above the shack (25 feet off the ground). And one end is attached to the outer wall of the shack. I've noticed with a field strength meter that wires in the shack seem to radiate the transmitted signal. Is this possible?

My guess now is that the keyboard cable (long) is the problem instead of the mike cable (short) and after putting a pair of chokes on each end, I seemed to have fixed the problem, even at 100 watts. Yeah! I can talk and type again. Good for contests.

I guess I'll have to move the antenna before getting a kilowatt DX amp :-)

Hi Dean,

That seemed to do the trick. I thought it was the mike cable, but after trying Don's test with the dummy load, the problem seems to be direct form the antenna which is nearby.

So far, I talk and I get to do the typing. Much better.

It's fairly obviously RF from the antenna, flowing down the feedline as common-mode currents, and causing trouble when they pass through the shack on their way down to ground. You should try to eliminate/reduce the RF currents, more than to RFI-proof the mic lead.

If the antenna is coax-fed, try winding the coax to make a choke, or use ferrite beads/rings.

On the other hand, you may have more success by *not* attempting to make the ground lead too effective. A friend had very similar RFI problems with a quad (gamma matched and coax fed) and an upstairs shack. He tried all kinds of chokes in the coax with only partial success. What completely cured the problem was to disconnect the extra RF ground, and to wind the mains lead to the shack around a stack of about 6 large ferrite rings(*). By blocking any RF path from the shack to ground, he removed the 'incentive' for common-mode currents to flow down the coax and into the shack. It cured the RFI in the shack, and also cured breakthrough into both his own and the neigbors' hi-fi.

Note that all three wires of the mains lead (line, neutral and also earth/ground) were wound through the ferrite rings, so he still had an effective ground for mains safety.

(*) Another good source of a ferrite core for a large mains choke is the deflection yoke from a scrapped TV set - about 10 turns shows a fairly high impedance all across the HF spectrum.

I'm looking for a GOOD PC-based scope and spectrum analyzer. It must cover at least the entire audio frequency range but the higher the frequency response the better. However,I don't want high frequency response at the expense of accuracy and display features.

What hardware/software packages are good? Is the Velleman PCS64i digital oscilloscope for PC a good choice?

Thanks.

Jim Rybak

In a thread in this n.g. I asked for suggestions on catching a thief on video who is pilfering office equipment. Thanks to all who have offered such creative ideas.

Now I need a video camera, the smaller the better. This volunteer center where I've been asked to help catch the pilferer is -- how do you say -- not cash-heavy. So, I'm asking for the loan of a survelliance camera, or as a tax write-off (the center is an IRS non-profit organization). Or, if you must have cash, will consider this last.

Camera must have NTSC video output, and require only a single power source. Color prefered, but b/w is acceptable.

Sorry about my modified return address, but I hate getting spammed.
My correct address is provided below if you choose to e-mail me.

Thanks,
Dave

Don't bother. Using a rhyme puts too many mental steps in the process.
You end up mumbling to yourself and counting on your fingers when all
you need is a direct visual - number mapping.

Try ftp://ftp.eskimo.com/u/m/mzenier/colorcd.gif
(A chart of the digits, 0 to 9, with each digit rendered in the matching
color, at least on my monitor).

Make up a chart like this and have them sort a pile of resistors.

>Pk-Pk, and you're trying to receive signals with just a microvolt Pk-Pk. We're
>talking about over 1 million to one ratio, or 120 dB of isolation required.

How about more isolation?

I remember -174dBm as the noise in a 1 Hz bandwidth in a resistor.

Also HC logic can be pretty powerful -- I've seen designs using it for
high level LO drivers. I'd guess high end processors would
have I/O (off chip) drivers which could push some power if
loaded.

Where do you want your "noise" floor -- microprocessor switching
leakage or input noise limited?

Also beware that "filtering" isn't all that easy (or at least not
obvious). I'm looking at the 3rd edition of "Freqency
Synthensizers: Theory and Design" by Vadim Manassewitsch.
See chapter 3 on shielding.

I like the section on p 185 about the shielding requirements to
obtain 130 dB isolation between modules at 1 KHz. These
are closed modules -- assume no entries, this analysis is just
concerned with the electric and magnetic fields which travel
through the module walls.

Apparently two aluminum walls 125 mils thick separated by one
inch of air can't isolate the magnetic field at 1 KHz more than about
76 dB. Higher frequencies have more attenuation, this is
worst case, but your microprocessor will have sub-harmonics
at all kinds of frequencies (probably depending on what
it's doing).

[steel at 125 mils he shows as 110 dB at 1 KHz, still not
the 130 dB he's looking for].

Perhaps you can try to keep the frequencies higher
and avoid the low frequency magnetic field problems.

But I've heard a radio with a rotary encoder which had audible noise when the encoder was rotated...

You probably want to build the radio in multiple boxes (die cast?) and connect all signals with shielded cables (and/or balanced?). You'll also need good bypassing on all power...

Goldreged wrote:
>I read about the stripline filter for 6 Meters in the ARRL RFI book.
>I need a unit for full legal limit.

You almost certainly DON'T need a stripline bandpass filter. Its single high-Q circuit has just about the worst possible combination of characteristics: a very sharp peak and rather poor skirt rejection.

You don't say what the RFI problem is. Maybe it isn't a transmitter problem at all. But if your transmitted signal does need cleaning up, you need to think more carefully about the kind of filter you need.

Your transmitted signal should contain only harmonics. A lowpass filter (or a multiple notch filter) will have much better harmonic rejection than a bandpass.

If your transmission genuinely does have close-in non-harmonic spurious products, it's either a parasitic oscillation in the PA or driver stage, or else the signal from the exciter is impure. Obviously a filter is no cure for an oscillating amplifier. Also, bandpass filtering to clean up the exciter signal should have happened way before the PA, at a very low power level.

If you're suffering from receiver intermodulation, you probably do need a bandpass filter but it doesn't need to be capable of handling 1.5kW.

> Will it make the grade?

You haven't said what you really want it to do... but probably not. In a high-Q circuit at 1.5kW, you can expect over 10kV across the tuning capacitor, and circulating currents of a few hundred amps. In other words, expect fireworks!

>Any suggestions?

Be sure about what you really need, and then check the ICE catalog or web page for appropriate filters.

Source record: 73039

There is this single chip UP
called 89c55 .

It is 8051 with 256 bytes RAM and 20 Kb of ROM
+ 32 + I/O pins.

Why would anyone need anything better than that
to program a stupid PLL chip, read Keyboard,
write to display and flips a few IO bits ???

What exactly would be the purpose of
68K chip and4 MB RAM be ????
Would he need a 1 GB hard-drive also ????

Why dont people learn proper Embedded Design ???

Should people look at SOME DSP modules like the

Motorola 16 Bit DSP + Microcontroller DSP56L811
Or the ADS21061 chips .

These are more or less single chip and powerful chips

That thing might even help people implement
do the digital processing process which has become
integral to modern

DIGITAL COMMUNICATION RECEIEVERS.

Micros are going to be there , as they implement the
things like Channel coding, decoding, channel synchronization
Forward Error Correction Radio control functions and DSP
filtering etc.

Look inside your favorite Cell Phone to find out how the RF
analog sections and DSP processing plus complex computer
and User-Interface stuff has been successfully integrated ,
and how they have used DSP to actually overcome
Rayleigh fading (channel combining in Time domain and Rake
4 channel receievers)

So, DSP/Microcontrollers Definitely belongs in the HF or VHF receivers, but
need succesful and intelligent design.

It has been held that the sending in of a registration card is not necessary in warranty or support cases. IMNSHO, all it does is get you on mailing lists that propagate like wildfire. Most of the time, I need nothing further from the manufacturer. In the small cases in which I DO need more from the manufacturer, I provide them with the necessary proof of ownership, if asked.

I have no gripe with RT Systems per se, except that I think they are WAY too paranoid in their copy protection scheme. Every time I defrag my hard drive, I have to reinstall the software. That torques me to no end. As soon as the Linux software is available, I'm switching.

Goldreged wrote:
> Well, I have a new IC 706 MK II radiio. Just running stock high power gets into
> my TV (fixing w/ filters & chokes) & 2 different cordless phones(have to work
> on today)

What channel on the TV?

(channel 2 is directly above the 6m band, a *very* sharp low-pass filter
can sometimes help channel 2 TVI. The 4th harmonic of 6m falls into
channel 11, so a decent low-pass filter might help with this channel
too. If you have interference in other TV channels, it's probably the
TV responding to your 6m signal itself - no filter you can install on
your rig will fix this. (without breaking your rig!))

Likewise on the cordless phones. No harmonic of the 6m band falls into
any cordless-phone band. Unfortunately, "pre-900MHz" cordless phones
usually used 49MHz to go one way, and 46MHz to go the other way. A
sharp *high-pass* filter *might* help with these, though these receivers
are made very cheaply & I rather doubt they'll work properly near a
high-powered 6m transmitter no matter how clean the 6m rig is.

I think a liberal application of choke cores to the leads entering the
TV and the cordless base units is likely to be much more effective than
anything you can do to your ham gear.

>breakthrough into both his own and the neigbors' hi-fi.

There's a very important lesson here. Most hams seem to think that grounds
solve RFI problems, but it is very often the case that grounds make RFI problems
worse. Ground has no magical properties, it isn't a noise sink. Think about
desirable and undesirable RF current paths before willy nilly adding grounds.
A ground can be exactly the wrong thing to have.

Remember that balanced antennas don't need grounds to function, and shouldn't
have any RF current paths to ground (lightning suppression is a different topic).
A choke balun at the antenna feedpoint can often choke off common mode currents
on the feedline, so RF can't come back into the shack by that path. (Or leave the
shack by that path, find the antenna, and sneak back down the inside of the coax
to the radio to cause computer hash in its receiver. The problem can go either
way.)

GREAT SOUTH BAY AMATEUR RADIO CLUB & SUFFOLK COUNTY RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - MARCH 7, 1999

On March 7, 1999 the Great South Bay Amateur Radio Club & Suffolk County Radio Club will again sponsor an indoor Hamfest. The location will be at the:

Knights of Columbus
400 South Broadway
Lindenhurst, Long Island, NY

There will be radio equipment, electronic componets, computers and access-ories, softeware, books, technical manulas, ARRL information, Amateur Radio License Exams, Door Prizes. General admission is $6.00.
Free Admission for spouses and children under 12.

VE - ARRL - 12:00 NOON
For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam session. 1999 ARRL/VEC fee is $ 6.45, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

For vendor and additional information pleas contact, Peter Portanova WB2OQQ at(516)541-4886. Email info@gsbarc.org

Talk-in will be via W2GSB Repeater on 146.685 4Z(136.5) PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 pm on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

Hi ALL!

Does anyone have a small, SIMPLE circuit for a 455kHz BFO oscillator
using easy to find (ie: Radio-Shack type) parts?
I do have a small junkbox as well.

I've built a SW converter for my AM car radio and want to add SSB/CW.

Many thanks! ve9aa - Mike

Repeaters, yes. Base stations, not unless there is a
properly licensed control operator at the base station. This
was ruled upon a LONG time ago.

>The trouble with this is that the FCC restricts what kind of
>conversation can take place on the two-meter band.

And every other ham band as well. So does international
communications law. Ham radio is not a common carrier where
"anything goes".

>If you use a repeater to, say, order a pizza, that is considered
>"commercial use" and the FCC can come down on you like a load of
>bricks.

Or a load of cheese. You are "beginning to see the light".

>Also, I'm not sure how security works on such repeater
>systems. How would I prevent someone else from using it to make
>a long-distance call?

That's the easy part. Digital or analog codes are permitted to
establish communication, and in fact the licensee/control
operator is required to ensure that unauthorized persons do not
access his/her station.

>One alternative might be to use the FRS band, since that is less
>regulated and offers some kind of rudimentary security. The
>trouble with that is, I don't know of any FRS radios with DTMF
>keypads. Are there any?

The FRS is not permitted to be interconnected with the public
telephone network so you won't find any such devices on the
market (legally).

>Better still, are there any amateur transceivers that can
>transmit a full-duplex, encrypted, digital signal? If the answer
>is no, then why is the amateur market so technologically far
>behind cellular?

The answer is no, and the reason is that amateur communications are not allowed to be encrypted for security. Say it in the clear or go to a common carrier (mobile radiotelephone, cellular, PCS) service. Nothing stops full duplex as long as it is in the clear. We have a number of 440 MHz folks who use it in the San Francisco area.

2269. Crazy big Western Electric tube 5795: picture URLs

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-26 00:00:00 UTC
From: Rick Francis <research@uoft02.utoledo.edu>
Message-ID: <36D724B6.A694CC32@uoft02.utoledo.edu>

Cross-posted to: alt.ham-radio.marketplace,misc.industry.electronics.marketplace,rec.antiques.radio+phono,rec.audio.tubes,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.swap,sci.electronics.components,sci.electronics.equipment

I have this cool weird old W.E. tube -- jus the thing to impress your
friends, squish your enemies. It is quite DENSE, as is the current owner
for dragging it home. Perhaps this can be rebuilt and used by someone
somewhere? Or maybe YOU want it as the ultimate item for your tube
collection! Check out the pictures in the URLs below: it has its own custom
wooden shipping/storage crate, so it COULD be shipped. Contact me if
interested, or if you know of any place that buys up stuff like this.

Thanks,
Rick Francis, rfrancis@glasscity.net

Tim,
If it doesn't drop to 1:1, how close does it get? Depending on your radio, the antenna may work just fine even if the SWR is not exactly 1:1.

> I am moving the hose
> clamps up and down to match 50ohms which is my feedline, and I have been

> min SWR THEN trim the antenna for an even better match?
>

Look at it this way. At the end of the half-wave section (where it meets the quarter wave matching section), the impedance is very high. At the bottom of the matching section, the impedance is very low. There should be a "sweet spot" somewhere in between where the impedance is exactly the impedance of the transmission line. This assumes that the impedance is real (no reactance). If you can't get a the SWR to drop down below 2:1 somewhere along the length of the matching section, then the impedance is probably reactive due to some combination of the conductor lengths and separations. In that case, you will probably have to adjust the length of the half-wave section. See a message I posted on the 24th. 73, Bill N3WK

Gregory,
I'd suggest that you try to implement the whole controller in a single chip CMOS microcontroller. If you build it with a bus and external memory and I/O, you're almost sure to be frustrated by hundreds of 'birdie' responses causes by radiation from the bus. You're going to have to contend with the processor clock and all the harmonics of divided-down sub-harmnics. In general, smaller and more compact is better, and you can't get smaller or more compact then having everything on the same chip. Also, you'll want to carefully bypass the power supply to the controller, and every signal line that enters or leaves it. This is almost impossible to do on a high speed bus, so consider having a small number (1 would be good) of low speed serial busses to drive peripherals like PLL's, display, etc. This way, you can bypass them well enough to eliminate RF, but still pass the serial data. Also, consider putting the whole controller in a shielded enclosure.
Remember, your controller generates high speed waveforms with several volts Pk-Pk, and you're trying to receive signals with just a microvolt Pk-Pk. We're talking about over 1 million to one ratio, or 120 dB of isolation required. Be forewarned.

I use a temp controlled iron that Jameco sells for a little under $100, any iron of moderate wattage and *very* fine tip will get you there. I occaisionally mount 208 pin QFPs with 0.5mm pitch. Trashed several before I developed the technique, though. Any pitch coarser than 0.5mm is a breeze.

I also have a hot-air pen from OK. It is very useful for some things, but you can easily get by without it.

It is essential that your board have a very good solder mask.

The other tools I find indespensable are cheap (strong) reading glasses from WalMart, a flux pen from Digi-Key (looks like a magic marker), and ChipQuick (magic stuff for de-soldering fine-pitch parts without destroying the PCB).

>[snip]
>
>That last remark is an important one, and maybe an over-riding one.

Because "lightning protection is a different topic" I didn't mention
that the installation I was describing had the coax grounded at the base
of the tower for just that purpose. It made no difference to the RFI.

Actually there wasn't any conflict between the RFI considerations and
lightning safety in that particular case. The lightning ground was in
the right place - *outside* the shack - and the direct ground lead from
the shack was only creating an additional lightning path *through* the
shack. The installation was actually safer without it.

Winding all three mains conductors into an RF choke doesn't affect mains
safety; and it does create a higher impedance to the high-frequency
components of a lightning pulse, making the path through the shack to
the mains ground less attractive.

>

Your rig is almost certainly clean enough already. (In the unlikely case that it's faulty, it needs a repair, not a filter.) Making the output even cleaner will do nothing to solve the RFI problems. It will only waste the goodwill of your family and neighbors, as they witness you trying a "cure" that fails to work.

The problems are almost certainly "out there", with the appliances that are suffering the RFI - so "out there" is where you need to be working to make them more RF-proof. 6m is a particularly difficult part of the spectrum because there are lots of near-resonant lengths of leads and power cords that can act as quite effective pickup antennas.

>I havent heard of ICE, but I'll check your website for a link, so if it's not
>there, just post it.

ICE make a good line of RFI filters, both bandpass and lowpass. (I'm not located in the USA, but they seem to advertise in every US ham radio magazine.) But now you've explained the problem, it's pretty clear that filters on your rig are not the answer.

>Thanks alot for your help.
>I have the ARRL RFI handbook, but need more 6 Meter info.
>If you have any suggestions....

Actually, yes: join the RFI mailing list (send a "subscribe rfi" message to majordomo@contesting.com and then follow the instructions you'll receive by e-mail). Some very helpful and competent people contribute to that list, including W1RFI, the man from ARRL who "wrote the book". It's not a very busy list, so you won't be swamped with mail... I just keep my subscription ticking over in case it's needed.

There is an artical in the Sept 1996 issue of QST. Page 78.

It states they are special slected 1N21 for operation in the square law area. There is a Struthers part number given as an example SS-13154-1-n where the n is a digit that identifies the diode to a specific plugin. The artical sujusts that if you have a number of the diodes, you can try them and probably find one that will work. Test in the range so that 50 mv across the 2 K ohm meter movement gives full scale. If the diode operates in the square law region at this power level and is sensitive for the low power level, it should work.

Probably most of the diodes will work, but will not be accurate.

Guess that you know that you can take the knob off the top and there is a seperate adjusting screw for each power range under the cover plate.

2286. anti-muting tuning mod for Sony 2010

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-27 00:00:00 UTC
From: Will White <wcw@asu.uswest.net>
Message-ID: <36D7FE54.85234C4D@asu.uswest.net>
Source record: 72982
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.shortwave,rec.radio.amateur.misc

I read somewhere a while back that there is a mod for the Sony 2010 SWL receiver that allows tuning without the receiver muting in between 100 Hz steps. Allegedly, it really improves tuning weak stations and tuning under heavy QRM. Sounds sensible to me. I'd be happy if it just removed the "thumping" between tuning steps and the accompanying flicker of the S-meter and rapid peaking/nulling of the audio.

Can someone point me to a net-based or print source for this mod? I have the Sony service manual, schematics included, so if someone can guide me to the info I need to perform this mod, or describe even just the general principle (if such things can be safely generalized, hi, hi) I'd be forever in your debt. Well, OK, for a few hours anyway. . .

I cleaning up my ham shack. I have the following IC's for sale or trade. This list is only about 5 - 10% of all I have. I am looking to sell or trade them with some one that can use them. These are brand new chips. Quanity count is by eye only , I picked 3 bags and gave them a count and found all them to have more than I have stated. I don't guarntee the count , but I tried to be conserative. Some of the IC's are the AJ case but most are AN. Several manufactures. If anyone is interested, I will catalog the rest of the IC's.

Part # Quanity
Total

7400 25
7401 50
7402 100
7404 75

Colin Caulkins wrote
>I would like to bypass cellular providers by having a transceiver in my
>car and another at home which is connected to the phone line.

It's not that easy. Cellular is a low power, multi-site solution. In order
to
do what cellular does, you are going to need a very high antenna, or
oodles of power at both the home and handheld.

>Also, I'm not sure how security works on such
>repeater systems. How would I prevent someone else from using it to make
>a long-distance call?

The best plan would be to shut off long distance. Most repeater controllers
have this function.

> One alternative might be to use the FRS band, since
>that is less regulated and offers some kind of rudimentary security. The
>trouble with that is, I don't know of any FRS radios with DTMF keypads.
>Are there any?

FRS (Family Radio Service) is a very low power service. Tones are not
legal,
because the FRS shares frequencies with repeaters and they petitioned the
FCC to make sure tones weren't legal. The audio also uses 2.5 kHz deviation
I believe. It's a real failure, not anything like what Tandy wanted.

> Better still, are there any amateur transceivers that can
>transmit a full-duplex, encrypted, digital signal? If the answer is no,
>then why is the amateur market so technologically far behind cellular?

It's not a technical problem. Ham radio is not in competition with
commercial
radio. If it was a free-for-all then Hams would bury the commercial market,
because we don't have to have standards before deploying the service.

It's a legal issue. We are restricted by law. The law says no codes,
ciphers,
or anything to hide the content.

Just pay your Cell phone bill, and quit dreaming of getting a free ride in
life.

It would be easy to digitize the voice using one of the methods
acceptable to the FCC. That would effectively encrypt it as far
as 99.9% of amateurs are concerned.

Hi,

I have a TI-83 graphing calculator that has a data jack on the back for connecting 2 calculators for simple communication. After figuring out the protocol, it looks like there are only 3 lines, say A, B, and ground. A and B are both bi-directional, and have two states - high (+5 volts) and low (0 volts). Does anyone know of any schematics that could be used for this? I want to do something as simple as possible (I'd think that this would be a lot more simple than a voice transmission). If possible, I'd like to be able to transmit a couple miles. Does anyone have any plans/schematics for something like this? Thanks.

Dan

A range of ten miles would suit me, since that would get across the city.
How much power would that require? I'm assuming the mobile unit would be
something installed in my car, rather than a handheld.

> It's not a technical problem. Ham radio is not in competition with

And what a crying shame *that* would be. I consider the Internet to be
the model for all communications. The Internet has done quite well
without FCC regulation. New protocols are being developed all the time
and users accommodate by upgrading their software. When their hardware
can no longer handle the software they want to run, they upgrade that as
well. The main problem with the Internet is that it requires a costly
infrastructure that must be paid for somehow. Unlike fiber-optic cables,
however, radio frequencies exist naturally and therefore should be
accessible for free.

> It's a legal issue. We are restricted by law. The law says no codes,
> ciphers, or anything to hide the content.

Attempts by the government to restrict the use of encryption on the
Internet are scoffed at. Why are hams so willing to accept such
restrictions?

> Just pay your Cell phone bill, and quit dreaming of getting a free ride in
> life.

The government built the roads and highways and therefore has the right to
regulate their use. The government did not, however, build the radio
spectrum. Much as they would like to think otherwise, the government
doesn't own the airwaves any more than they own the air. Should I pay a
license fee for the right to breathe? After all, every lungfull of air I
take in is a lungfull of air someone else could be using, and that person
might be engaged in more productive enterprises than I am. Perhaps the
government should sell large amounts of air to commercial interests who
would then resell it to individual users? Of course, there would also be
amateur air-breathers, but they must be licensed and their use of the air
restricted (no playing of wind instruments or blowing up balloons).

I think if the FCC had its way, it would sell off the entire radio spectrum to big business. But (fortunately or unfortunately) many hams are retirees with lots of time on their hands to petition the FCC and lobby congress. They offer up decades-old stories of ham operators who were instrumental in emergency situations. So, large amounts of spectrum continue to be devoted to hams talking about little other than their equipment and what bullshit the no-code license is.

Depends on the city. The number of buildings, interference, etc. I'd
probably
try 50 Watts on 440 to start.

Here's how you do it. Go to the Hamtronics Web page, and purchase a
2 meter transmitter, at about 50 Watts. Then buy their 440 receiver. Now
all
you need is their cheapo repeater controller, and a Dual-Band antenna and
duplexor (Comet makes a good system), and you are done. Just buy a
dual-bander for the car. You'll need about 50 Watts to go 10 miles with
varying terrain.

As long as you use this for personal use, or for emergencies, then you are
fully compliant with the law. If you use this for business, then you are in
competition, and will be shut down.

You've gone off on a tangent here. #1 you want a telephone system that is
basically free (after purchasing the equipment). If we commercialize the

Ham bands and go into competition with capitalists and big business, we
will lose. The reason is, they will buy our frequencies, and we'll be done
as
a hobby. Hams do not have 1% the PAC power that the commercial people
have.

>
>> It's a legal issue. We are restricted by law. The law says no codes,

You don't need encryption for a hobby. Encryption means privacy, and
Ham radio is public. We accept such restrictions because it is a law.
Just like Freon and Crack Coccaine are laws. You can do whatever
you want, but as Grandpa asked: "are you willing to do the time, or
pay the fine?" I suspect it's cheaper to buy a scrambled cell phone.

>> Just pay your Cell phone bill, and quit dreaming of getting a free ride
in
>> life.
>
>The government built the roads and highways and therefore has the right to

Wrong. They did. Before the FCC and regulations, radio operators just
set up shop and jammed each other. The Government was needed to
regulate and impose standards. Same with airplanes. Ask all the Rock
Stars, and Country Music stars who died in plane crashes, whether they
think regulations are bad? (if you can).

> Much as they would like to think otherwise, the government
>doesn't own the airwaves any more than they own the air. Should I pay a

>restricted (no playing of wind instruments or blowing up balloons).

This reasoning is completely flawed. Here's what I propose. #1 You
decide if you want to persue a technical problem, or #2, a legal rights
problem. You are a child of the "Individual Rights" machine in America.
I'm from another Era, and that was "Community Rights." In my youth we
worried about what was good for "the people" and not what was
"good for me." Would having a free-for-all in the radio spectrum be
good for "the people" or even good "for me?"

Now, take your chosen thesis and develop it into a well reasoned essay
that is *against* what you believe should be the law.

Come back with the essay, and I will give you College Credit for anything
I feel is above C quality. it. It must be at least 2000 words, and have a
bibliography with at least five referenced works (Books, not magazines,
or newspapers, or internet). You should be able to do this in three or four
evenings at the Community College Library.

>I think if the FCC had its way, it would sell off the entire radio
>spectrum to big business. But (fortunately or unfortunately) many hams
>are retirees with lots of time on their hands to petition the FCC and
>lobby congress.

We exist at the benevolence of the ruling class. As the Ham population
dies off, Hams will be in no position to maintain the spectrum allocated.
Unless some plan is in the works, Ham radio as we know it, will pretty
much be dead above 50 MHz, by the next decade.

>They offer up decades-old stories of ham operators who
>were instrumental in emergency situations. So, large amounts of spectrum
>continue to be devoted to hams talking about little other than their
>equipment and what bullshit the no-code license is.

You can turn Ham radio into a big internet and telephone company, but it
will cost just as much as if you just paid for what is available now.

I have many fine working items for 902MHz with no hardware modification:

Antenna specialist 8 pole tunable helical filters.
Motorola tunable band and gain low noise preamps.
GE/ Ericson 45watts continuos duty RF amps with miliwatt drive levels.
Scala, Decibel, and Katrine broad band 9 dbd gain omni antennas.
Motorola receiver 6 way and 4 way splitters.

All of this is commercial high end manufactured.
The filters are fantastic to look at on the tracking generator.
Any trades or offers will be considered.
Preference will be given to Midwest candidates to avoid shipping.

I will trade the above equipment to anyone interested.
I would like to see more interest in using the 900 MHz band.
I need easy to convert transceivers.
All of my transceivers have non tunable Ceramic filters and are set at
824 to 849MHZ on receive with 45 Mhz split.

I have schematics of all the equipment if anyone would like to try
rework a whole Unit.

The book doesn't mention pizza specifically but that's the way I read of the rules. So long as Pizza Hut doesn't get a ham license to take pizza orders. Some of the control ops around get really hyper about calling any business though (and I guess that's there prerogative since they have control of the repeater). Some don't want you to call your wife at her office even if the discussion is not business.

Mouser Electronics has magnet wire (#16) but I don't see anyone with #35.
That's pretty small wire. Mouser has #28 if that helps.

2312. ten tec 2M-6M transverter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-27 00:00:00 UTC
From: Andrew Peppper <haggis@superior.net>
Message-ID: <36d896bf.0@nebula.superior.net>
Source record: 73008

Wonder if anyone can give me any answers... I have built a 2M to 6M Xverter from Ten Tec.. Set it up as per the manual.. When using it I get a lot of noise (S7-S9) in the 50 to 52Mhz part of the band... I was under the impression that 6M was very quiet... Has anyone else experienced this... I have also tried different antennas with no avail... Could this be local interference ??? when I disconect the antenna the noise dissapears which makes me feel it's local and not generated internally..
Thanks in advance for any suggestions :)

Your cell-phone or PCS bill is not a fee for using the RF spectrum -
it's a service fee to pay for the cell-site infrastructure and personnel
involved in keeping it all working. Let's keep our feet on the ground
here folks...

From what I have seen around my house, the 6 meter band seems to be the worst band from 3 to 432 mhz. Seems that every computer I have around the house wnats to put out some trash in that band. Talking with others, seems that many devices such as tvs, clocks and other items that have microprocessors in them want to give off something in that band also.

How about taking three surplus PC power supplies (you can have them for less than $10 each) and wiring the 5 Volt outputs in series?

Many are rated at the 20+ amp you need on their 5 V outputs.

Sure, you will have 15 V instead of 13.8V. Just add a couple of (heatsinked!) high current diodes in series to drop the voltage a bit.

The radio doesn't receive in a 1 hz bandwidth, it receives in a 500 hz or 2 khz bandwidth. Doesn't matter though. No matter what bandwidth it has, the ratio between 1vpp and 1uVpp is still 120 dB.

I used a simple coax stub quite successfully to get rid of TVI in the
family TV - (1/4 wave open at the far end) - just trimmed it till the TVI
disappeared. Obviously it was just intermod in the TV front end. You could
do the same for your neighbours if you are on speaking terms

>have any RF current paths to ground
>(lightning suppression is a different topic).
[snip]

That last remark is an important one, and maybe an over-riding one.
Think about it: Static from wind or a nearby electrical storm builds
up on your balanced antenna (with no ground). It tends to develop a
potential on both legs of your antenna, all the time looking for
someplace to flow. The easiest way to earth ground (where it would
naturally go) is through your rig's power transformer's secondary to
primary leakage impedance, or via the gap formed between the secondary
and primary windings. That, and the circuitry between the antenna and
your power transformer (i.e. your receiver front end and your
transmitter final). Eventually it ends up looking for the neutral
(grounded) side of your electric power service. Bet you can guess the
rest of the scenario. When it reaches a high enough potential,
current is going to flow, probably disastrously. Hopefully, your body
wont be part of the pathway.

If you're going to operate an antenna without an earth ground, PLEASE
consider placing a gas discharge tube between your rig's ground and
earth ground, for safety's sake. (a gas discharge tube across the
coax feedline isn't going to help in this case)

regards,
monty, N5FC

>
>John

These are RTL. 926 = Single JK F/F with set/reset inputs
914 = Dual 2 input NOR Gate
958 = Decade Counter

The 958 is one of the CuL (Counter MicroLogic) family. Most likely
this chip is driving a 960 BCD Decoder/Driver chip in your counter.

RTL was termed Micrologic, sold by Fairchild and Motorola Semiconductor
in the middle 60's to early 70's. It fell into disfavor when DTL was
introduced.

RTL was an interesting logic family and enjoyed some linear applications,
but had very poor noise immunity (about 200 mV) as opposed to about
1 volt for DTL and TTL. You can confirm your chips are RTL by measuring
the supply voltage at 3.6 volts +/- 10%. The pin at the tab (metal can)
or flat (plastic) is usually Vcc, opposite pin is ground.

DTL and TTL are pretty much compatible, operating at 5 volts. Fair-
child called DTL/TTL Compatible Current Sinking Logic; DTL was
replaced by TTL when Texas Instruments brought out its grassroots
74XXX line. DTL had a resistor pullup (2K for normal DTL, 6K for
low power) in its output stage while TTL utilized a totem-pole
output structure with active pullup, giving it greater switching
speed and current driving capability.

Hope this helps somewhat.

That's going to be one big Tesla Coil!

I usually get my magnet wire at a local Electronics store. Most places will
have it or will be able to order it in.

There are any nunber of amateur dual banders that are full duplex
encryption would be easy but is not legal on the amateur bands thus
no equipment of that nature is available for general amateur sales.
So amateur radio is not so technologically far behind cellular just
a bit hide bound by regulation.

Greetings,

I have a Struthers URM-120 wattmeter from the 1960's. I blew one of the diodes in the 2-30MHz slug. :-(The diode has a marking of:

ALPHA D4190-A 8703

It is about 3/4 of an inch long and looks like a 22 bullet with a point.

Are these special diodes, or simply in this form factor to be simply "dropped-in"? I have access to a hobby lathe and can make a plastic "shell" where a conventional diode can be placed inside. Are the diodes typically your off the shelf items, silicon, germanium, schottky, etc?

Need help with a direct replacement, or equivalent that I can make into the form factor.

Any thoughts or recommendations on diode performance over the HF band (3-30MHz) would also be helpful. Something tells me that a high performance switching diode would work just fine.... as the military stuff is over engineered for good reasons. I will look in the ARRL books to see what they use in their 2-30MHz watt meters.

Thanks in advance,

Al, NW2M

TESLA (Transient Electronic System Level Analysis) from Tesoft
is a very capable system-block-diagram-level simulator which is
very useful for folks who are deisgning and evaluating (through
simulation) designs from baseband up through RF ... including
complete end-end systems.

See http://www.tesoft.com

I don't work for or have any affiliation with Tesoft, I'm just a very
satisfied user.

If you're looking for transistor-level RF design/simulation TESLA
is NOT the right tool ... take a look at Eagleware/Genesis
at http://www.eagleware.com

I have no affiliation (other than being a user) with the Eagleware
folks, either.

Neither of these software packages is "cheap" if you mean
"a hundred dollars or so" or even "$2-300" ... but they are
FAR less costly than anything else I'm aware of with similar
capabilities.

>> GM1YMI/W2

I have operated on six using a ten tec 20 to 6 transverter and i had lots of noise coming through it. it seemed to me, in addition to the fact that six is full of man made electrical noise, that the mosfet rf amp in the front end of my 1210 was "hotter" than it needed to be and increased the noise up to s7 sometimes. other times it would be very quiet. i had (i sold) an icom 706 that was quieter on six and was plenty sensitive. i drove the transverter with a ten tec argosy which has no rf gain control. however, the tx sounded great with this setup! good luck.

Thanks for the lead. I think I've got the reference to the article:

TI: Radar detector to microwave receiver conversion
AU: Noll-SJ
SO: 73-Amateur-Radio-Today. no.365; Feb. 1991; p.10-12, 15.
PY: 1991
RT: Journal-article
CP: USA
LA: English
AB: Self-contained receivers are designed to detect police
speed-measuring radar energy just above the 10.0-10.5 GHz Amateur
Radio Service allocation. Although there are plenty of these on the
market, many of them are expensive for experimenting. The
reasonably-priced BEL XKR-IX Micro-Eye model is a
dual-conversion superheterodyne X-band and K-band detector. The author
explains the necessary modification.

Now all I have to do is find a Feb. 1991 issue of 73 magazine....
Thanks again es 73,
de N4ONS.

Return loss is another way of looking at VSWR. It is more meaningful
for very small mismatches. For example, a return loss of 26 dB is around
a 1.1:1 VSWR as I recall. 40 dB RL is about 1.02:1 VSWR. 2:1 is around
10 dB RL.
The new MFJ259B has a RL readout.
I would guess the ARRL Handbook probably has the formula for relating
VSWR, reflection coefficient and RL.

We have indeed seen some excellent quality communications privacy (encryption devices) gear showing up for sale at regional ham fests for use with amateur radio VHF/UHF equipment.

These items are very popular and reasonably priced. The vendor has several demonstration units set up at ham fests and potential buyers are encouraged to try out the gear before buying.

This is high-quality equipment, not junk!

2350. Re: Homebrew HF Transciver

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-28 00:00:00 UTC
From: gbowne <gbowne@email.msn.com>
Message-ID: <OeICNT6Y#GA.261@upnetnews03>
Source record: 72893

Dear Newsgroup:

It seems I have the Happy99.exe problem, and I (think) have fixed it. I just noticed tons of my posts with "Re: Homebrew HF Transmitter" in the subject.

And I still need sources of Female 8 pin Microphone connectors. Local RatShack's can't locate any. They can locate only male 8 pin connectors which were in stock.

I have decided on using the 80C31 and 8051 series processors, and have purchased a few examples. I think this is my best bet.

My project is pretty much per "Build your own intelligent amateur radio transceiver", Tab Books, Autor: Randy L. Henderson (ISBN 0-07-028264-1), exept with a few major improvements, some asthetic.

My chassis is per SpireAudio See: Http://www.spireaudio.com and is 6" H x 17" W (L to R) x 10" L (Front to Rear). Cost $99.00. Could revise Transceiver later by making it 2" Taller and Wider, to 8"x19"x10".

The Chassis front panel is .250" thick ALCOA (Aluminum Company of America) and is and is silver annodized. I did have an old .125" ALCOA plate of 6061 (billet) which was 6" x 17"

Are SO-239 jacks standard for antenna's?

How are Morse Code "CW" Paddle Keys connected? Are they plugged into a 1/4" Phone Jack?

My plan inlcudes 1 each 4 pin and 8 pin microphone jacks, which are switchable. Has decent red rocker A/C power switch from RatShack mounted on front panel, and a Jameco #JR101 AC Power connector (see pg. 63 of current catalog) which is mounted on the rear panel of the rig next to a fuse holder from RatShack.

The rig will have bands from 10m to 160m

Thanks,
Gregory Bowne

>consider placing a gas discharge tube between your rig's ground and
>earth ground, for safety's sake. (a gas discharge tube across the
>coax feedline isn't going to help in this case)

Static build up on antennas is *extremely* low current. It has nothing to do
with lightning safety, which is an *extremely* large current. Static neither
attracts nor discourages lightning strikes. It is a separate phenomena.
A gas discharge suppressor can help snub lightning surge, when installed
properly, but it is exactly the wrong thing to use to cure static buildup problems.
Static will build to the gas tube's firing potential, it will fire and discharge the
static, then the cycle repeats, over and over. In your receiver, you'll hear
POP POP POP as the gas tube fires.

The correct way to deal with static buildup is to use a *high* impedance
connection between the antenna and Earth. A 1 megohm resistor will do,

a RF choke will do. The idea is to drain the static, a very small amount of charge, while not shunting the desired lower voltage higher current signals you're transmitting and receiving. A megohm in shunt with the 50 ohm impedance of the line will be virtually invisible to your equipment, but it will nicely drain off static buildup (nanoamps). It will keep the gas discharge tube (which you should have too for snubbing lightning surge) from ever reaching firing potential, so no POP POP POP in your receiver. But it won't snub the voltage of a high current lightning pulse (kiloamps), so that will still fire the gas discharge tube and protect your equipment.

The conditions for static buildup and for thunderstorms are nearly diametrically opposite. When you have one, you don't have the other, and vice versa. Conditions have to be very dry for static buildup to occur. Lightning is most common when conditions are humid. In areas where thunderstorms are common, you probably won't need a static discharge shunt impedance. In areas where high static buildup is common, you may not need lightning protection (at least statistically, lightning can occur anywhere, so you should always protect against it, but it is most likely in areas which frequently experience thunderstorms). Note that both lightning protective grounds and static drains should be *outside*, not at the station. You don't want to invite either static or lightning indoors. The entrance bulkhead (your ground window) should be arranged to stop them from coming inside.

Now all that said, there is no RF performance reason, or RFI suppression reason, for a station RF ground when using a balanced antenna. It doesn't help, and it can hurt. If you use an unbalanced antenna, then you must have an RF ground, but that ground needs to be out at the antenna feedpoint, not back at the station. All you need back at the station is a safety ground. That can be a high impedance to RF, as long as it is a low impedance to 60 Hz and DC.

Also, if the guy wants 3 pounds all on one roll, that can be a problem at places like Newark. Maybe they have it, but my experience has been that they will only have 1 lb rolls. For the 16 AWG, I'd visit a local motor rewind shop. For the 35 AWG, assuming that's really what he wants, do a search on the web for magnet wire. There are a couple companies that I've come across looking for Litz wire that I think also do single-strand, and they are able to supply odd gauges, and even sizes in between gauges, though you better be prepared to pay for it! Names that come to mind are New England Electric Wire Company, www.neewcweb.com/index.htm, and MWS, www.mwswire.com/. But if you enter +wire +magnet into an altavista search, you'll come up with many other suppliers. Some of these companies list local reps and stocking distributors, and someone will probably be willing to help you out.

I've gotten _small_ quantities of odd-gauge magnet wire from Amidon Associates, but they are in the business of selling cores, not wire, and the wire is just to help the core customers. (Small toroid cores.)

Regards,
Jay

2361. Re: magnet wire?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-28 00:00:00 UTC
From: jayomegac@aol.com.wospam
Message-ID: <19990228013643.14110.00001316@ng-ca1.aol.com>
Source record: 72904

I just posted a couple references for magnet wire. While I had my browser open, I looked at a couple others. It looks like WireTronic, Inc., solicits small orders. (3lbs is a very small order for a company that deals in only wire, at least for copper magnet wire.) You can find them at www.wiretron.com/magnet.html. They show the common credit card logos (like VISA) on their home page.

Source record: 73015

Feb. 99 QST has a modified chebychev lowpass filter.
The insertion loss is more than 20db better than the 7
element chebychev at the second harmonic!
The graphs show "Insertion loss vs freq." and
"Return Loss vs freq"

What is return loss?
If it applies, relate this to a 50 ohm signal source,
and the load seen by it.

Is a higher number better? (20 db vs 25db)

Mike

Well, to keep it really simple, think of it as another numeric for reflections from a load (like VSWR). A return loss of 0 dB would mean all energy put into a transmission line or a load was reflected from that line and/or load (none absorbed), while an infinite return loss would mean total absorption of the energy in the transmission line and/or the load. Since it's in dB it's a log scale so its useful over a wide range.

If you're interested in this, you might want to spend a little time looking into S parameters for two port networks. They can express both the transmission and reflection parameters in very useful ways! That will lead you to Smith charts - a really neat tool.

2370. Re: Return Loss, Please Explain

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-28 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01be6355$8f60ac40$d0efabc3@default>
Source record: 73020

Return loss is another way of measuring/defining the
Reflection Coefficient and VSWR in terms of a power ratio.

If at ANY POINT in a two-way transmission system, the ratio
of the reflected power to the forward power is P =
(reflected power) / (forward power) then -

Return Loss = 10 * Log (P) decibels.

P is obviously the square of the modulus of the Voltage
Reflection Coefficient at the point where the reflection
occurs.

It is usually desirable that return loss be greater than
some specified high value.

It is most commonly used by long-distance telephone line
engineers as a measure of degradation of system performance
due to reflections. On long lines, usually amplified at
intervals, reflections cause echos. Echos and the delay of
an echo can make a mess of both speech and data circuits.
But poor performance can be corrected ONLY at the point at
which the reflection occurs.

It is important to remember return loss data ignores the
time delay between the forward and reflected signals. It is
only at the point of reflection that the time delay is
zero. Only there are VSWR, Reflection Coefficient and
Return Loss directly related to each other.

Return Loss data is not of much practical use on very
short, low-loss lines such as antenna feeders. It ignores
phase shift and angles. Better to think in terms of R and
jX impedance and SWR.

They did no such thing. I walked up to their table at a hamfest and exchanged Federal Reserve Notes for a small cardboard box that contained: a diskette and a 2 to 3 converter. The software is the entire new version because this is how they do it. They gave me no special or wonderful service in fact sold me yet another adapter that I did not want or need. Their copy protection is a nightmare the only thing worse is how they treat recent customers when a new version comes out.

Although I haven't seen a problem in Astro's with electric speedos(some Astros are cable driven and therefore not affected) CAUSING radio interference(probably because I am usually putting UHF or 800 radios in them), I have seen a possibly related situation. I frequently install Taxi meters in various vehicles and have noticed that Astro vans in particular tend to PICK UP interference in the speedo wiring which causes the taxi meter to advance even when the van is stationary. In extreme cases, it will even cause the speedo needle to move. In some cases, rewiring the ground side of the sender (Its located on the tranny case near the driveshaft, driver's side) clears this problem. In other instances, checking the grounding between engine, battery, and chassis has proven useful. On at least 2 occasions, I have had to simply refer it to the dealer. I suspect there is some sort of odd wiring on this particular model, either a ground loop of some sort or just awful shielding or such because this problem doesn't seem to happen on either Caprices or full-size vans which use the same transmission and a similar electric speedo.

2376. How to build UHF repeater from 2 mobiles?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-02-28 00:00:00 UTC
From: Tony Szablowski <a2112szablowski@worldnet.att.net>
Message-ID: <7bbppg$e94@bgtnsc02.worldnet.att.net>
Source record: 73026

Yep, I've seen plenty of info on converting Master 2's and Motorola's
into repeaters, but I've got 2 Uniden programmable 25W mobiles that
I'd like to make into a repeater(Rx: 462, Tx: 467MHz). A few
questions, please.

What's needed to be done to the mobiles?
What's needed for the radios so they don't get desensitized (quickly)
in a crowded tower site?
Can a tone-panel be used with this setup for 2 PL's, 1DPL operation?

I really appreciate any and all help you folks could give.

>
Return loss is another way of describing mismatch
and yes higher is better.

In this case,

RL = -20 log(rho)

where rho is the reflection coefficient:

rho = abs(gamma)
where:
gamma = (Zl-Zo)/Zl+Zo)

when Zl is the load impedance and Zo is the line
or system impedance. (Both complex)

The VSWR is:

VSWR = (1+rho)/1-rho)

So you can see return loss, VSWR and reflection
coefficient are different ways of saying the same
thing.

Contrary to what else you might read in this
thread, all of these numbers apply at the point
where you make the measurement. If there is line
loss (isn't there always) then the numbers are
different at different points on the line, but it
doesn't have anything to do with time.

>6.What hampers the low frequency response?
>7.Would it be possible to gang 2 of these beasts without a noticable
>delay?
>tnx,
>matt
>

well, let's see,

get yourself a nortronics catalog, and find what you need.

you missed one obvious point. you must have bias to record. 40 to
maybe 100 khz and then you add the audio to it. the audio needs
special frequency boost/reduction tailoring. in short, just go buy
a used 4 channel 'porta-studio' unit for under 200 bucks used.

low freq limit typically 40 hz at -3 db for most units

can't gang side by side heads without substantial delay.

2383. Programming info on a uPD861C PLL

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Maybe your RF amp/mixer is being overloaded by strong signals locally but
not on frequency. (eg phones (48 MHz)) Lots of signals cousing intermod
are just heard as hash. Try 10 -20 dB attenuation - if the noise suddenly
disappears as you increase the attenuation this might be the problem. If so
you will need a stronger front end.

Back a few years (1950s and early 1960s as I recall) two stereo (binaural) formats existed. One was called "inline" and used vertically-aligned tracks on the tape. The other was called "staggered". The right and left channels were offset slightly and recorded / played by two independent heads.
I had an old Voice of Music machine which incorporated both modes of playback by providing a switch to move from one format to the other. Listening to an inline tape in the staggered mode was quite interesting :)

Lotsa debris to swap, depending on condition of 310.

Have a Nice KWM2A RE with rejection tune, a very nice Drake TR4CW (not
RIT) with blanker, PS, and MS4, A Drake TR7 with PS7, a Novice
station with HQ170A, DX60, HG10, Johnson matchbox, and old straight key.
A turbine looking thing that has been refurbed with paperwork. I think
it's a PTO as it is marked CSD (constant speed drive) and appears
to run on bleed air. Readuy to use, with documentation stating so.
http://www.atl.org/images/turbine.jpg application, Grumman A-6.
Also looking for an older HiFi speaker in unmolested, good, condition
to match the one I have so as to move up from HiFi to this new stereo
stuff everyone is talking about. Here is a PIX of the speaker.
http://www.atl.org/images/altec.jpg Not keen on selling any of the
gear outright at this time. Perhaps after I get the webserver rebuilt...
Thank you

An area hardly touched by experimenters and hobbyists is light beam communications. Many of the things currently being done with radio frequency techniques could be done with light. They can be done without any FCC license requirements. True, you have to have a line-of-sight alignment with the other station and yes some bad weather can block the signal. But, with no FCC to get in your way, high speed data can be transmitted over long distances (20 miles) using light. I have some information on the subject at my web site: www.DJandAssoc.Com within my "Imagineering On-line Magazine." I would love to see more experiments conducted in this virgin area.

If the matching circuits are transmission lines then
program RJELINE3 will do everything a Smith Chart will do,
much faster and exactly. Enter dimensions of a real line
and terminate with any impedance R + jX. Program computes
line performance, SWR and input impedance, R + jX.

Download in a few seconds. Not zipped up. One
self-contained file only. Can be run immediately. Data
input on a what-if? basis.

2400. Help: Passive Filters - Toroid Inductors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-01 00:00:00 UTC
From: Jack Hardin <jhardin@hal-pc.org>
Message-ID: <01be6431$49176e40$c081b4ce@jhardin>
Source record: 72931

I need some cheap 44 mH and 88 mH toriod inductors and/or some schematics
for passive audio filters for CW and SSB which use some other kind of
inductors. If you have any old 44mH (NE8844) or 88 mH (NE8867) toroid
inductors, let me know how much you want for them, shipped to me in Texas.
I need 2 of the 44 mH and 3 of the 88 mH.
Please email me direct -- I don't check this newsgroup that often.
Jack, KD5EDO
jhardin@hal-pc.org

Listen to two meters in any major U.S. city. It's
full of bootleggers from 144 to 148. Who the hell is
going to catch them all? It's an enforcement
nightmare. Mission Impossible! The commission
barely has resources to get people with call signs!
Bootleggers don't use call signs, at least legal ones.
Smell the roses & wake Up!

MicroSmith does that. You can also create a ladder matching network, with R, L, C, X, or transmission line elements in any combination, then see how the impedance changes on the Smith chart as you vary any element or the frequency. It's a great learning tool as well a graphical and intuitive way of designing matching circuits.

Message-ID: <7bib89$9nk@ds2.acs.ucalgary.ca>
Source record: 72777

I seem to have lots of applications for RF sources up in the high vhf to 1 GHz or so region lately. I'm hesitant to use oscillator/multiplier schemes to get there, as I lack the proper test gear to make sure they are clean. Is there some kind of "minimum parts count/minimum engineering" solution? I saw something once in a Plessey catalog that needed only 5 parts to give me stable, clean 900 MHz (one of the applications I actually needed!) from an hf crystal, but Plessey is not widely available in North America. Is there something more mainstream?
Thanks!
John

> I use a BayPac modem and HP200LX Paltop PC running BayCom software.

ok and how much does this cost? (not the WinCE but the modem ;) i still
need to make my home made cable work for the vx-5 to PC interface...so i
think i wont be able to build this... :)

> Well... for Mir a simple ground plane antenna is all the is needed. It's
> quite easy to work with a ground plane, I do it mobile from a patrol car
> with a mag mount antenna and at home with a homebrew J-pole.

ok my english vocabulary surrounding ham radio isnt very good...what is a
ground plane antenna? how does it look like?

> You can work AO-27 with the rig with just a simple whip antenna. I use my
> FT50 and a MFJ-1715S to work the bird almost daily. The Arrow antenna will
> work much better, but it costs a bit more than the whip. The price of the
> Arrow is not very expensive and you'll have an excellent antenna!

same here (:) what is an arrow antenna? the whip antenna is a metal antena
like on most car? :) (ill have to learn my ham-vocabulary soon =)

i wont do packet on the road but i ll probably try to do sats
though...(while walking i dont have a car :)

this is pretty new stuff to me, at what altitude are those sats? can you
be multiple people on 1 sat using ctcss tones?(or dcs) and are there
packet sats? how does it work? hehe :) (i m too much curious :)

also, if i try to build an atenna myself how do i calculate its impedance?
(is that the right word in english ?:/)

thanks a lot!

alex

2408. Re: Heathkit memories

Newsgroup: rec.radio.amateur.homebrew

Great story, Dave. Bet there are lots of other "stories" reading this and wondering whether to tell. We hope so.

Here's another Heathkit Memory:

It is the summer of 1953. After a year in college and exposure to other electronics types, mostly "hi-fi" and "stereo" freaks, I had to try and build something from a kit. Decided on a Heathkit VTVM, because, well, you have to be able to measure things, don't you?

It was a hard-earned $24.95 (??? Help me, I don't have the old catalogs here) that went to Benton Harbor, but it was my summer fun project after sweating hard on Iowa farms at $5/day to make next years tuition. The VTVM was such fun to build, those cool evenings in the damp basement, using the big new 250 watt 2-speed Weller soldering gun (another $10 or so) and the big soldering iron. (Still have 'em).

Dad thought I was nuts. He asked dumb questions like "what are you going to measure"? Well, um, how about the voltage at the wall outlet? It got a lot of measuring that summer. "Do you really need one of those?" Of course I needed one of those. "Well, then, why don't you use this acid core solder? We have lots of it."

I built lots of Popular Mechanics electronics projects in the late '40s and early '50s, but never met a ham. The local TV mechanic gouged this 12 year old $3.50 for a 20/20/150v electrolytic capacitor when that was a full days laborers pay, and he could easily have clipped one out of an old TV set and given it away. I finally met hams in college, and that Heathkit VTVM became the first piece of test gear at WN0ZSR. I still have it, and it works just fine.

Dad later became the very active W0LTB/W0KD, and built his own Heathkits. (1899-1986. RIP). So did a Son who built Heathkits, and a Daughter, and that VTVM played an important role.

True -- you stand a better chance of building a clean multiplier chain
"blind", than a clean PLL.

My first and only Heathkit was a CPO. I finally got my parents to give me some money to order a HW-99 , I think it was. It was on sale , I guess they were discontinuing it. I was too late , they sent back the check and told me they had no more. And my parents told me I couldnt have anything more expensive.....But I still have all those memories of getting that first homebrew regenerative receiver to work. Ill never forget tuning in on oldies 680 and hearing Ferry Cross the Merzy. Every time I hear that song it makes me smile .Such good memories come from being so involved with what you are experimenting with that all the worries of the world seem to vanish as you carefully melt solder around the leads of all those magical parts. The feeling is hard to explain unless youve been there. ......Doug N0WVA

> held to be in violation of the following:

I wonder what region? I've never seen one, either at Dayton or any of
the 'fests around Tennessee. Nor have I ever heard one on the air.
(despite scanning the entire band on numerous occasions, from a location
about 3 miles from a major interstate)

I *have* heard bootleggers in the 2m band. Two of them in 25 years. I
can live with that.
The ones in the 10m band are a much bigger problem - and unfortunately,
most are outside FCC jurisdiction.

I think what we're seeing here are trolls from people who can't accept
the idea that some people are opposed to no-code HF. (very unfortunate
- I actually *support* no-code HF, but this kind of troll provides
excellent ammunition to the other side of the debate....)

Hi All;

I am putting together a new radio site which will contain a section on modifications.

Do any of you have any good, or new mods for scanners, or transceivers? I already have the ones found at qth/qrz and barc.
What I am looking for is *new* mods, or websites where they can be found, although with the websites, only send details is those websites have the mods in text form, and not HTML

Also required are homebrew circuits, and QRP projects.

Thanks In Advance;
Stew

NO, NO, He said he wanted it to do it as though he were doing it graphically. I've been looking for a program like this too. You should be able to click a spot and draw a line, etc, move it toward and away from the generator, solve multiple stubs (graphically, not a specific programmed equation); kind of like using cad software....he dont want to enter a number and have a program compute another number. You can program a pocket calculator with the transmission line equations. What he is looking for, I think, and what I would like to see is a graphical program to let you play with a smith chart like you could do with a chart and a ruler and a pencil on top of a table. This way, you could use the chart applied to your own situation instead of having a few transmission line equations programmed.

Robin,

For a free program that might suit your needs try:

http://mot2.mot-sps.com/rf/designtds/mimp.html

If it's not what you want, well...it's free.

Otherwise, Roy's suggestion of the MicroSmith
program is a good one.

If he was unable to find what he is looking for within the next half hour, then I was offering something which MIGHT do the job he wants done, more easily and quickly. But he gave only a very vague idea of the purpose for which he wanted a computerised Smith Charts. You are not sure yourself about what he wants.

Regarding your own project - if you prefer to attach more importance to the tools you use than the final product, whatever that is, then good luck with your search. I have felt like that about a hobby myself and understand very well how you feel.

While you are waiting for something to turn up, why not download program RJELINE3 and DIPOLE1 and amuse yourself. Better than staring at TV programs. Absolutely free !

Actually, some of us learn graphically and visually better than
numerically. Smith charts were made for people like us. We can learn
more about circuit behavior by fooling with Smith charts, than we can
by application of formulae. When dealing with microstrip circuitry,
and uhf transmission lines, you're not going to have much success
applying "rule of thumb" and "cut and try" techniques, and even if you
get lucky, you'll not have learned much (except that you're lucky ;-)
In this case, tools *are* important.

: transmit a full-duplex, encrypted, digital signal? If the answer is no,
: then why is the amateur market so technologically far behind cellular?
Amateur radio is not really technologically far behind cellular. Take a
gander at the frequency that the cell system uses and you will see how
such a small device can have the ability to run full duplex. Then look at
the size of the duplexers that you need for say 2 meter full duplex
operation. By the way, in the ancient past car phones used to run in the
400 meg ranges and they had a trunk full of equeipment, well not full but
a rather large transciever/duplexer unit back there to accomplish this.
Physical size of components in the system are very decisive factors in the
game. Not so much the technological ability.

Monty,

Smith's charts were designed, for use by overworked RF transmission line engineers in the 1930's* to reduce the enormous computational labour involved with complex hyperbolic functions. We now have Intel and computer programs.

As computer programs are to Smith Charts, so pocket calculators are to log tables and slide rules.

*Smith simplified previous charts which had been in use since around 1900 by telephone and telegraph cable engineers. The earlier, more comprehensive charts, covered frequencies from 50 Hz upwards. Smith's simplified charts are applicable only at radio frequencies and approximations arise because of various assumptions. The assumptions were necessary to permit the charts to be printed on a flat sheet of paper. Otherwise they would have to be 3D.

The principal assumption is that the line impedance Zo is a pure resistance. Zo for real lines is never real. Errors caused by this assumption can usually be neglected on practical lines above 100 KHz. But it's just as well to be aware of their existence. Smith charts are useless on telephone lines and at power frequencies.

I have affectionate feelings for antique tools. Smith Charts fall into that category, even computerised versions. Long may they appear in our educational text books.

I think Bob, W9DMK, may have some software which automates use of Smith Charts. He is usually on the antenna newsgroup. I've mislaid his website URL.

The ARRL linear circuit analysis program Radio Designer has a feature called the Circles Utility. Radio Designer is a simplified, low cost version of the very expensive Compact Harmonica program.

The purpose of this Utility is as an electronic Smith chart. The chart appears on the screen and the user uses keyboard instructions to draw lines and circles of various kinds on the screen. It is almost exactly the same as using an actual paper Smith chart.

This chart is a YZ chart. Resistance and reactance are in red, conductance and susceptance are in green. Y and Z appear simultaneously and the chart is navigated by switching back and forth, with both in full view.

This Utility is excellent for designing matching networks, using LC components and transmission lines. It gives the visual interaction that the Smith chart provides and that you are looking for.

This utility is also used to do graphical design of amplifiers, using S-parameters. Complete instructions for doing this are provided.

The other features of Radio Designer take the values from the Smith chart and "analyzes" and "optimizes" the network that you have "designed" on the Smith chart.

A recent two-part article in QEX magazine describes in detail the usage of the Circles Utility. I am the author. I will email a copy of this in .pdf format if you want it.

Radio Designer can be purchased from the ARRL website for $150.

There may be a good general purpose chart program somewhere, but the ones I have used will only compute certain common calculations. A smith chart can be used for a lot more than just calculating the input impedance of a transmission line terminated with a load. After using one to solve a variety of problems, you get to where you can think on the fly and use it in a manner to work for the problem at hand, which may well not be the input to a line. As an example, consider a double stub tuner. These can be designed in a few minutes using a chart. Maybe some particular programs have a set of equations for this purpose, but some dont, and so far what I have looked at has some problems programmed, but isnt general enough to cover all possibilities. I admit I havent looked in some time and wouldnt waste the time looking unless I had a feel that something better than a few equations was available. This should be a natural use for a computer, primarily to enhance the accuracy of using a chart. The real advantage of having the chart (or a simulation of the chart) is to be able to see where you want or need to go before being there, if that makes any sense. Then sometimes, the method to get there becomes obvious. If a person hasnt used a chart much for anything but line input impedance, these last two sentences wont make any sense to him at all. A person who has will know exactly what I mean.

I didnt mean to ruffle any feathers, and I must say that I have used transmission line calculating programs since the early 80's. Indeed, if all you want to do is to calculate input impedance, etc, then it is much easier that screwing around with charts. Or complicated graphical programs, for that matter. But there are some problems that are more complicated and I just havent found a faster way than using the chart, albeit, the numbers in the end are only approximate. These are typically combinations of various line calculations as well as lumped circuit calculations, where the parameters are designed rather that being knowns and plugged in to get an answer.

I wouldnt be surprised if there were such a package as we would like, but I suspect that it would be an expensive item.

Again, sorry if I pissed anyone off.

Don

Heck, that's nothing. The inverter and trigger transformers in disposable camera flash units use something like #44 - #46! Talk about being weaker than a hair! :) Try to disassemble one of those without breaking the wire!

Since you apparently do not have the computer skills to determine this for yourself I'll help you. Every time you defrag the disk you have to reinstall the software. You cannot easily make a backup copy of the floppy disk. If you backup and restore your hard disk you have to reinstall ADMS. This is abusive copy protection. I got so fed up with it I hacked the copy protection in self defense. But naturally since Clint is satisfied all this crap is just fine. Give it break Clint I'll send you a buck buy a clue.

if it is a lift you probably hear at least one of 6 TV transmitters in
this country transmitting 5kW PEP with 60kW EiRP - here in JO38 it
sounds like S9+++++ of 50Hz hum starting 0700z and stays on at least
until at least 0000z

NG,

I certainly will, Monty. It's taken a year and a half or more to get where I am in the design process, and the procurement of parts which I may need.

The book has been a great help! I wish there was a web site based on the book, but there isn't. I was thinking about making one for my rig once I get it done.

Anyone else read that book by Randy L. Henderson?

Believe me, when the Commission needs to do something, it has a way of finding the troops to do it. "Think harder, work smarter...."

I should know - my job there was finding and coordinating troops for special targeted operations (I was chief of enforcement in San Francisco for 18 years). Some involved the amateur service, most involved other services.

You are right - smell the roses, and make sure what you are smelling is not yourself being held over the coals.

I use a BayPac modem and HP200LX Paltop PC running BayCom software.

> also how do i communicate with satellite at 5Watts? is there a special
> antenna for that?

Well... for Mir a simple ground plane antenna is all the is needed. It's
quite easy to work with a ground plane, I do it mobile from a patrol car
with a mag mount antenna and at home with a homebrew J-pole.

> Any suggestion for having more fun with this radio is appreciated thanks :)

You can work AO-27 with the rig with just a simple whip antenna. I use my
FT50 and a MFJ-1715S to work the bird almost daily. The Arrow antenna will
work much better, but it costs a bit more than the whip. The price of the
Arrow is not very expensive and you'll have an excellent antenna!

>is 1961, and I am young again..."

Yup. Not -quite- 1961, I built my first in 1976.

Sitting at my desk in July, the window open, a gentle breeze stirring
the solder smoke about my head as I assembled a HW-16 and wondering if
my Novice ticket would arrive before I finished it, and how would I
test the transmitter if it didn't? I knew I could use some light bulbs
for a dummy load, but I also knew they'd radiate from DC to daylight
(well, incandescent light), and the FCC was just WAITING for this new
Novice to screw up so they could yank his license before he even got
it, so I'd better wait...

Then Mom comes in, wanting to know what kind of trouble I was in NOW
because there was this letter from the FCC in the day's mail and she
just KNEW I'd blown up NORAD or something...

All to the tune of "Afternoon Delight."

A child of the 70's? Darned right.

Where's my soldering iron? I gotta build something.

Jim,

They're small-signal silicon diodes. Not bad for switching, I guess -
we use 'em by the ton at work for spike suppression in digital
signals, and even for slow logic gates.

National Semiconductor, Philips (was Signetics), and Motorola all make
PLL chips/chip sets that are rated up to 1.2 or 2.4 GHz. But PLL
doesn't necessarily guarantee clean - you'd probably want the same
unavailable equipment to design a PLL for that range.

Besides, I don't have a clue where to buy any of these parts in hobby
quantities. At work I but Motorola parts from Future Electronics (and
at my last job from Hamilton Avnet), but they all want to sell a rail
of chips at a time. I can't afford 18 chips at $20 each.

The proliferation of cellular and PCS is making UHF parts downright
cheap, if you can afford commercial quantities.

Can anybody point me to a source of small quantites (like maybe 1) of the Analog Devices DDS chips that are appearing in the Ham magazines? I tried to find a source of some Harris chips a few years ago, but the best I could do was (I think) Newark Electronics, and their minimum purchase was 18 pcs (1 tube) because it wasn't a stocked item, and they had to buy by the tube from Harris. At $30 each, a tube was a little too expensive.

2459. VFO recommendation?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-03 00:00:00 UTC
From: pje@haystack.mit.edu
Message-ID: <7bigal$8b5$1@nnrp1.dejanews.com>
Source record: 72790

Hi folks,

I've been reading through old posts here, and looking at various articles
and references. (Don't have a source of QEX articles yet, though)

I'm trying to decide right now what sort of VFO to build (my first one).
The myriad of options available now has my head spinning as to picking
a design. I hope you can offer me your considered opinions as to which
way to go, having been there and done that yourselves.

Here's my list of features:
- low drift (everyone wants this, of course)
- fairly wide coverage, since I'll use this with <<insert your favorite
Rick Campbell-derived direct conversion receiver here>>. I'd like to
cover 40 meters on up, but I can certainly start small with one or two
bands and expand from there.
- doesn't have to be portable.

Traditional LC or VXO designs abound, but I also see lots of "couldn't
get it to oscillate worth $#%" notes too. I notice lots of activity
around the AD9850 DDS chip, but then again I see people posting here
who don't like its SFDR (due to spurs) and who are worried about soldering
surface mount parts themselves. Plus, with the Jan/Feb 1999 QEX issue
and the original 1997 one, I guess there are now two published VFO designs
using this chip. (As I mentioned above, I haven't seen either yet)
It's certainly attractive for its complete coverage, but I have the
feeling there are some caveats.

So give me your opinions. If YOU were starting to build from scratch as
I am, which would you pick? A more traditional LC design? A VXO? The
all-purpose DDS? Which ones are "good enough" for most purposes, and which
are the rabid gotta-dig-that-last-ounce-out solutions? Importantly, which
ones are going to work nicely the first or second time, and which are going
to leave me fiddling with a trimpot and a spectrum analyzer for the next
6 months of lunchtimes at work?

Thanks as always,

Phil Erickson
pje@haystack.mit.edu

PS: Whatever it is, it's got to be better than the drift on the National
NC-125 tube receiver I'm restoring now. That 6SK7-G based oscillator drifts
when I look at it crossways! Maybe society was more patient in the '50s...

If per chance if you have a modulator deck for a T-368 transmitter, or parts there from (such as mod xformer, relays, etc.) I would like to hear frm you.

I have nice unit that was modified for MARS use by removal of the mod deck components.

The unit that I am restoring in a early non-lettered unit, but I can still use the deck from a C-F model if available.

Also interested in any other T-368 parts that you might have.

Thank you.

Yes, fairly good low-cost Si switching diodes. I use them a lot for
home-brewed digital and analog design. My recollection is that
they're similar to the antedeluvian 1N914 switching diode. Typical cost in
unit quantities is around $0.05 to $0.10, depending one where one purchases
them.

Cordially,

2477. Re: VFO recommendation?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-03 00:00:00 UTC
From: hkelle@rhi.hi.is
Message-ID: <7bkejn$69o@eldborg.rhi.hi.is>
Source record: 72808

Hi

I'm currently building my first VFO as a part of a project of
designing a direct conversion receiver. The VFO is to be used
for the 20meters and thus covering the range from
14,000MHz to 14,350Mhz. Here is what I am doing, might
be interesting to you:

So far I've decided up on most components and built an oscillator
prototype.

I'm using a series tuned Colpitts oscillator. Why series tuned?
Because I read somewhere that someone tried both a series and
paralell tuned one and found the series tuned more stable.
Theoretically there should be no difference and I had to
make a choice :)
I choosed Colpitts because it is easyer to use two capacitors
than to place a tap on the inductor (not much difference though).

The inductor I'm using currently is a solenoid coil wound on
chem. lab glass, 14mm diameter and I use a magnet wire with
0,65mm diameter. With about 18 windings I got the size of the
inductance to be 4.23uH and its Q was 180. These values were
measured with a HP network analyzer (neat instrument :-)
Today I wound a similar coil on a PVC plastic pipe and
will compare that to the other one. Then I'll probably compare
it to a coil wound on a #7 toroidal core.

The chem. lab glass should give excelent temperature stability as
the glass is very unsensitive to temperature. I use
styroflex (polystyrene) capacitors as they have good temperature
stability. I will probably allso use one or two trim capacitors
in the final version to set the desired frequency range excact.
I think ceramic trim capacitors have low sensitivty to temperature.

Mecanical stability is very important too. Today I was listening
to the drift of the oscillator on a receiver and because the
coil had no support other than the wires it was wound from the
frequncey drifted quite noticably when nocking on the table it stood on.

Proper shielding is ofcourse very important! If not properly
shielded you can vary the oscillating freq. just by walking
across the room.

As the amplifying device I use a n-channel JFET, 2N4416. Why?
Because it was avalilable at the local electronic components shop.
Other general n-type JFETs should work too.

I'll use varicaps to tune the freq. of the VFO. I choose
to use BB204B varicap from Philips. This device is actually
made from two diodes with a common cathode. That should
minimize non-linear behavior.

Next I'll design the buffer to place in front of the
oscillator. It has to be as unilateral as possible.

Hope this helps.

For what it's worth, the J310 may be the same thing. In a twenty year old Siliconix FET data book, both the U310 and J310 use the same set of performance curves. The J310 is in a plastic case, and the U310 is in a metal case but other than that there is no clear indication of a difference. I imagine the plastic cased ones are cheaper, and perhaps more common.

If there are no frequency related spurious (harmonics and the like) then a simple band split combiner will be adequate. If, on the other hand for example, some particular harmonic of, say the 2 meter transmitter falls within the passband of the 6 meter receiver, there ain't no way you're gonna make it work anyway. Suggestion: Try the two repeaters through a combiner into a dummy load and see what happens. Band reject duplexers, the kind we can afford, do not suppress out of band emissions very much. A transmitter suck out cavity on each opposite receiver may be necessary, depending on the specific hardware. The old tube type boat anchors were better in this regard. We all had to relearn the isolation curves when solid state came along.

Richard,

I recommend LVIEWPRO. It'll read a LOT of bitmap image formats including BMP, JPG, PCX, GIF, etc. It'll convert among these formats as well. The only bitmap graphic format that I've encountered that is -doesn't- handle is CGM. (It doesn't do your HPGL, either.) It'll crop, resize, adjust the color depth (anywhere from 2-color to "millions of colors"), and it has image enhancement algorithms like contrast adjustment, edge enhancement, etc. I believe it'll rotate in 90 degree increments, too. and it'll even mirror horizontally and vertically. You can get it from Simtel.Net, CDROM.COM, and other common shareware sources.

As for schematic and PC board software, I'm starting to be impressed with CIRCAD. It'll output BMP files directly.

Dave

Which ones are you looking for? While the Harris chips can indeed be
hard to get in onesies and twosies, the various Analog Devices chips
are no problem. Try Newark, or Future/Active, or just about anybody
who carries Analog Devices parts.

No, they don't sample them on their web page. :-(

The first DDS VFO I built used a Qualcomm Q2220 chip from an article
in 73 (I designed my own Basic Stamp controller board for it). Am I
showing my age here? :-)

They go a lot higher than that (e.g. LMX2325), and if local distributors fail you, try Digi-Key.

Depending on the accuracy and stability you need, the various VCOs (e.g. Mini-Circuits) can solve a lot of problems too. They're idiot proof, and can be just the ticket for sweep oscillators and such. I once aligned the frequency multiplier stages in a VHF receiver's LO with the help of such a VCO, a direct-conversion receiver, a sawtooth oscillator and a scope. Ugly (*really* ugly), but it worked.

You'll need a VCO for your PLLs anyway.

For the past week, Newark's Web site hasn't been answering my calls. Future Active's Web site doesn't seem to have a catalog, at least not that I can find. (I called them for a print catalog and got their little flyer thingy - looks like it's geared toward TV repair and telephone installers.) Pioneer admits to having the chips - now I have to find out if they'll take plastic.

> No, they don't sample them on their web page. :-(

Heh, heh. They'll sample -me-! I'm an electronic design engineer. (Well, actually, the title if Sr. Software Engineer, but the reps all know I'm about as good with a soldering iron as I am with an editor.) But conscience dictates that I not accept samples for what will amount to a personal project. My work isn't likely to require a DDS synthesizer.

But DSP chips, that's another matter...

> The first DDS VFO I built used a Qualcomm Q2220 chip from an article
> in 73 (I designed my own Basic Stamp controller board for it). Am I
> showing my age here? :-)

I'm not familiar with it. What issue (or year) was that published? I've contemplated building a DDS with TTL chips, and EPROM for the sine table, and a DAC. But it wouldn't be very fast - a few MHz at best. But I'm mainly interested in longwave anyway, right now. And since I've found a way to make PC boards without shelling out $3 a sheet for toner transfer paper, time spent wiring up chips isn't as big a problem.

Thanks for the tips on the DDS sources.

Dave

There is only one book I could reconmend. "Microwave and
Wireless Synthesizers - Theory and Design" by Ulrich L. Rohde.
It will cost you a bit, but is by far, one of the best books
on PLLs with practical examples and analysis of current PLL
devices and how to use them.

Regards,
Luke

Forget wire wound. What you would have would be a variable lossy inductor.

Any of the others are worth the look, but have you considered using a couple of FETs (one in series and one in parallel)? Then you could control the resistance with a DC voltage. FETs are available that work up to 100s of MHz or more.

From: Eamon Skelton <die.all@spammers.org>
Message-ID: <7bn472ppb1@scotty.tinet.ie>
Source record: 72741

Everyone has their own particular favourite VFO. I have had a
lot of success with the series tuned Colpitts (Clapp) oscillator.

I use a JFET Clapp oscillator in my H/B transceiver. It runs
reliably at various frequencies between 9 and 23 MHz,
despite the fact that the feedback capacitors are fixed
at 220pF for all bands. Stability at 9 MHz is quite good,
about 200Hz per hour, not so good at 23 MHz. I use a
digital stabilizer (Elektor Feb. 1998) to keep the VFO
stable on all bands.

The Franklin oscillator also makes a good VFO.

Remember that VFO builders are worse than fishermen
when it comes to telling tall tales. Don't believe the stories
about the 30Mhz VFO with less than 10HZ drift. Most
crystal oscillators are not as good as this.

The AD9850 should make an excellent 7 MHz VFO. You
can get the data sheet from: www.analog.com

Message-ID: <NOSPAMpfriedr.116.008C5651@azstarnet.com>
Source record: 72743

Hi:

I recently had the good fortune to get my hands on some old, arcturus-type globe tubes. They are blue glass, but unfortunately unmarked. The person I got them from, however, indicated that he was told they were #27's.

Anyhow, I found a pinout and specifications for the #27 in an old book, and wanted to play with a simple radio receiver circuit. The book shows the filament voltage as 2.5 volts.

Yet, when I applied 2.5 volts, the filament was frighteningly bright. In fact, at 1.5 volts, it's a medium yellow color. All I've ever played with before are glass miniatures and common octals, and I don't recall their filaments as ever being more than a bright red (when properly energized).

Anyone have any experience with these old tubes? What should the filament look like when properly lit?

Please copy to email, and thanks in advance (remove NOSPAM to send)

The standard 10BaseT termination value is 100 ohms (although anything
from 50 to 200 seems to work fine in practice). However, you need to
use genuine Category 3 or better UTP cable for runs exceeding a couple
feet. Residential-grade telephone wire is often not twisted pair.

>
>The transmitter in question is 2Km away.

I think his point was, that if the interference is as a result of a
spurious output from the transmitting station, no amount of filtering
is going to remove the interference, because there really *is* energy
at the frequency of interest.

The question, then, becomes: given common tools, how does one
determine whether it is a spurious output from the police transmitter,
or inter-modulation/overload in the receiver? (overload seems
unlikely if the transmitter is 2 Km away)

Putting some attenuation on the front end (say 10 dB) should eliminate
intermodulation / overload as the cause, for the purposes of
troubleshooting. That having been determined, how does one convince
the local police radio engineer that she/he has a problem (assuming
that person will come forward and identify him/herself)?

Good luck! Let us know how it comes out.

Hello!

I have finally done a project which was in my mind for some time... a CDial!

Well, now you will be asking yourself: what is a CDial?. A CDial is, as its name says a 'CD-dial'. Logical, isn't it :-)?. It is not new to use a CD-ROM as a dial but my approach is somewhat different and can give to your homebrew rig an special and unique look.

I have just made one CDial at the moment which is the one I have pictured in my WEB pages at:

http://www.geocities.com/SiliconValley/6992/cdial.htm

Please, I would appreciate if you take a look and let me know what do you think.

Thanks!

Best regards.

Source record: 72753

Since it uses the 02A PLL, moving to 10 is a snap...Just one xtal
change is all you need and then retune...73 Magazine had a lot
of articles on this back in the 70s and 80s.....you can probably
get a reprint from 73 if you write or call them and ask
(they are located in Peterborough, NH I think...unless Wayne's
senility has taken over again)

Moving to 6 is a bit more complicated BUT can be done....the
xtal you change is a high side injection xtal in the 3x Mhz
range (35 or 37 I THINK)...and the 1st IF is 10.7 or 10.695.
its been a while since I did one so this is somewhat from memory!

To go to 6mtrs you merely change the LO relationship to LOWSIDE
injection (so the xtal remains in the same range)....so it would
be become 50-10.7 or 39.3 MHz....BUT this will cause LSB and USB
to FLIP since you have changed injection side....so a relabel of
the front panel would be needed (no biggie!)..plus you would
have to modify all the 27MHz coils to 50 MHz resonance (unwind
some turns and maybe change a cap or two)....BUT getting on 6 SSB
these days will be a blast......personally I dont know WHY
someone like Uniden or Ranger doesnt come out with a 6mtr allmode
25-40watt model like the HR2600 on 10, etc...if they priced it
around 200 or so, it would sell like crazy! I'd BUY ONE!! :)

Hope that helps!

If you are running split site (which I assume you are?) and
will not be using duplexers to keep the TX out of the RXs..
then you can easily tie the 2 TXs together by using a LP
filter for the 6mtr side with a cutoff of say 70MHz and a HP
filter for 2 with a cutoff of say 140 MHz....the COMET or
DIAMOND diplexers for crossband operation will work just
fine for this...or you CAN easily homebrew...
BTW a DUPLEXER allows you to operate DUPLEX (TX and RX)...a
DIPLEXER allows you to feed multiple TXs into the same feedline.
A CROSSBAND coupler (also called diplexer) allows different
freq band TXs OR RXs to share one feedline......

It could be done but wont be easy Paul....the front end has to
be moded to 220 (take 2-3 turns out of each helical), the VCO
would have to be moded (take some inductance out of that ckt)
and the PA would have to be moded to pass 220....possible but
not easy....(you could likely remove the PA and put a SAV-15
brick in place of it which the PLL would easily drive to 30+
watts....it only needs 100mw drive max)

Whats the model number?
The Motorola design on the model numbers are:
1st letter is typically a T meaning Transistorized power system
(used on all models since the MOTRAN solid state models)
The 1st number is power level....7=100 watts, 9=250-330 watts
lower numbers=lower output down to a 2 = 5 watts
The 2nd number is band (actual range depends on TLN number
on RF boards!)...1=30-50 MHz, 2=VHF 144-174, 4=420-512 MHz,
5-800-900 I think....(3 is used for 225-400 MHz military I THINK;
VERY RARE!)...the rest of the model number tells you TX type,
RX type, and other options....soooooooo a typical number like:

T71RTN is a 100watt (7) LOWBAND VHF (1) MICOR (RTN)
T63GGV is a 50-70watt (6) HIGHBAND VHF (3) TUBE type "T power"
(GGV)
Thats a basic rundown....So what is your model numbers?

To move the CB, DONT touch the PLL chip or its xtal....
find the main LO xtal (a 37 or 39 MHz xtal)...change THAT
by how much you want to change Channel 1 (take the lowest
freq you want on 10 then subtract CB Channel 1 at 26.xxx MHz
and ADD that difference to the xtal freq and order one from
ICM or similar....then retune the rig! And youre on 10!

Hello! I would like to build a dual-band 10M/6M antenna for my truck. I was thinking something with a 54" base section (resonant on 6M), with a coil/stinger arrangement on top which decouples the base on 6M and resonates the whoe structure on 10M.

The antenna doesn't have to be a high-gain, high-bandwidth affair. I just need to reduce the number of antennas emanating from the vehicle.

I'm not a physicist, nor antenna guru. This idea may not even be possible. Rather than flame me for being ignorant, I'd appreciate any constructive ideas anyone might have.

Thanks much!

Hi Will:

Yes, Electric Radio has projects such as that from time to time, although any old handbook would give you ample infomation to design around the parts you find. It is fun.

Generally a handbook from 1946 through 1960 would be fine. Hit a local swapmeet and you should be able to find one for $5 to $10.

Good luck and 73, Colin K7FM

Watch out! many PLL in CB use the same crystal for the inloop mixer, and
the pll reference, and maybe even the IF. In order to change them, you have
to leave the on board crystal as the reference, then add an outboard
oscilator for the inloop mixer only.

I have used a few of these for LMR or amateur use, but have so far only
used ones in their design range. Many of them have been converted
to ham bands.

There is information on the web, but it's spotty. Here are a couple of URLs:
http://www.brinkleyelec.com/Radmod.htm
http://www.seits.org
and follow the links.

Here is a brief description of model numbers. The model number on
your Micors will be something like, for example: T73RTN3100

The meaning of these characters is:

T - Trunk mount. Alternatives are D=Dash, U=Universal, H=Hand, P=Portable
and some others, but Micor mobiles are all "T".
I have been assuming you have mobiles. Base stations
could be "B", "C", "L".

7 - 110 watts output power. For Micors this number will be in the
range 4-7 for power out from about 40watts to 110watts.

3 - VHF High band (138-174MHz). Alternatives are: 1 - Low band (25-50MHz),
4 - UHF (406-512MHz), 5 - somewhere around 800MHz.
There might also be a 2 for 70MHz.

No radio will cover the full range. You need to look at the
numbers stamped on the transmitter and receiver. The fourth
digit will be in the range 1-4 and specify the subrange.
On VHF subrange 2 covers 2m, 3 is most common for 150-160MHz LMR.

RTN - These letter designations are for the receiver, transmitter
and power supply. For Micor mobiles I don't think you'll see
anything except "RTN"

3100 - The last four digits give various options such as 3 = PL,
1 = narrow band, this can also tell you the number of channels.

There might be a couple of additional letters (e.g., AK) which would
be a version and packaging indications that I don't know much about.

Let us know what you have and what you want to do.

73,
Gary

2535. 2m to 6m Transverter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-05 00:00:00 UTC
From: Michael Anderson <michaela@qualitau.com>
Message-ID: <7bp2c1$931@journal.concentric.net>
Source record: 72766

I am exploring the idea of making a home brew 2m to 6m transverter. I understand the concepts and circuitry for the hetrodyne conversion, and I pretty much have that portion designed, it's very similar to an AM modulator.

My question is more of a "lower" tech matter: How do I keep received signals from feeding back to the output converter and transmitted from feeding back to the input converter? By necessity the receive input and the transmit output are connected together, as are the transmit input and the receive output. Obviously I could use a PTT switch, but one is already enough to handle on the 2m rig. If someone knows what is typically done I would very much appreciate an answer.

Thanks,

Michael Anderson

Weird. I've found chips that are in the Newark catalogue, but that
the database has never heard of (e.g. AD607). But I've never had any
difficulty connecting to their web page.

Even Future/Active's main catalogue isn't very big (I have a copy).
I've always had better luck phoning and asking.

> Heh, heh. They'll sample -me-! I'm an electronic design engineer. (Well,

>
> But DSP chips, that's another matter...

If I invoke the name of my school-cum-employers (I'm an M.A.Sc. student)
in vain they'll sample me, too. I've gotten samples for personal projects
as well, usually by attempting to purchase the item in question and having
the person at the other end decide the paperwork isn't worth the hassle
for one or two chips...

Many companies don't seem to mind sampling to serious experimenters.
The weirder the part, the better. :-)

The Techno-Whizzy DDS VFO, 73, December 1992. Far Circuits still
offer a PC board for it, but the Q2220 chip may be hard to find now.
The chip is parallel programmed (24 bits worth), lending itself to all
kinds of abuse - I tested mine with a diode matrix and a big bag
of 1N914s before plying it with microcontrollers.

The ARRL Handbook seems to have a fair introduction to PLL's in recent editions, maybe for about the past ten years or so.

There's never been much in the way of advanced material on the topic in an inexpensive book. Howard Sam's once had a book "Design of Phase-Locked Loop Circuits, with Experiments" by Howard Berlin which was a reasonable hobby-based coverage of the topic as it was twenty years ago when the book came out.

The other books that I've seen mention made of tend to be expensive and aimed at professionals. Someone mentioned the Rohde book; I imagine it would be nice to have but I've also seen the price. There's a chapter on the topic in his "Communications Receivers" book, which is also expensive but I once got as part of a book club sign up.

F.M. Gardner's "Phaselock Techniques" always shows up in bibliographies about synthesizers, but considering it came out in 1966 (or was there an updated version later) it probably covers more than you want to know about the topic of PLL's but completely misses a lot of changes in implentation that has occurred since then.

There have been plenty of articles on PLL's in the ham magazines, though most have been about construction rather than background or design. Ham Radio magazine probably had the best articles, including an article by Rohde, "Modern Design of Frequency Synthesizers" in the July 1976 issue.

But aside from the older material being more about the theory of PLL's, they also suffer because IC's have become the heart of PLL's and new devices have come along since the articles came out. One of the better sources of material on the subject, once you've dealt with the basics in something like the Handbook, is the manufacturer's data sheets and application notes. They are far cheaper to get than a $90 book on PLL's, and will tell you how to use the device in question. This is especially a consideration when modifying commerical equipment, since you want to know what's in there, not a more generic understanding of the topic.

Motorola has always had good data sheets on their PLL products, like the old MC4044 phase detector (it went on for pages), and presumably for their

all-in-one (or more or less) synthesizer IC's that show up fairly often in commercial equipment. Signetics was always a good source of information on their line of PLL's like the 565 and the 560, which of course weren't really intended for synthesizer use, and one oculd probably find an old databook from them at a ham fest. `The common PLL these days is the CD4046 (and variations that allow for higher speed operation and some I gather provide improved operation). RCA alwaqys had a good data sheet for it, though RCA isn't around anymore. One company has a program tht you run for designing synthesizers using the 4046; I think it was Phillips. I got the program as shareware at a computer show some years ago, but don't have it handy to check for it's name.

If you're modifying equipment, it's worth looking inside and finding the PLL, and then trying to find the datasheet for it. The problem with that being that there are IC's used in commercial equipment that can be hard to track down information on.

As for CB sets, a lot of that area has been covered in 73 years ago.

Over the years I've seen a lot of articles about VFO's and in just about
all of them, the author's said "this is the best". Since they can't all
be "the best" I imagine that no particular oscillator is far
superior than all the rest.

However, the variations in design often have a purpose, because someone
needed to work with existing components.

It seems to me that there are certain things that will make a good VFO,
and it has little to do with the specific oscillator chosen. Things like a
good tuning capacitor, or whatever is used to tune the thing. A good
solid box to build it in. A good inductor that's not going to be bothered
by temperature or movement. Good voltage regulation, which of course has
become easier with the switch to semiconductors. Good isolation between
the actual oscillator and where it leaves the box.

I am also looking at PLLs in hobby quantities. I looked hard but have been unable to find anyone that will sell me either the Plessey or the Philips parts.

But the National part (LMX2325) is available from Pioneer-Standard
http://www.ied.pios.com/
for $6 in quantity 1 by web page order with credit card. Also National has a lot of support for PLL design. They have software that will design the loop filter for you. And they have software that will load the PLL registers through the parallel port, and show you a picture of the various register contents on screen.

Motorola has a pin compatible second source for the LMX2325. But so far I haven't been able to find a way to buy the motorola part in small quantities. The Motorola part is bipolar and the National part is cmos. National has a way to switch between two different loop filters using an analog switch. Motorola does the same thing by replicating the charge pump, because they can't make an analog switch in bipolar. It is possible design a circuit that will work with both parts, if you know about this quirk. But if you follow the National app notes too closely you will find that the motorola part will not work.

Regards,
Bert Douglas

>The weirder the part, the better. :-)

There was an article in CommQuart a few years ago that dealt with precisely this problem. It pointed out that semiconductor manufacturers are like drug companies, in that development costs far outweigh production costs. Once the line has begun to roll, it may be a good investment to sample to anyone who might have a chance of influencing future purchases, so don't be bashful about trying - you may be pushing at an open door.

Another good point the article made was that if you present yourself as a prototype designer and developer, you'll stand far more chance than if you say you're a hobbyist looking for a fun project. The suggestion was not that you lie, of course, but that you present yourself in the best possible way. It's well worth a read.

Strange. I got a phone call yesterday from an amateur requesting
socket connection for an 3RP1 old oscilloscope tube, it was found in
ARRL 68 handbook, and some years ago I bought some inexpensive 2AP1
tubes for RTTY XY-scope, data was only found in 48 and 49
handbooks....

heater info for '27' is 2.5V 1.75A, but often a rheostat was
connected in series with filament those days around 1930 to reduce the
excitation to the minimum neccessary level for proper operation

and my favourite VFO type is the 'Seiler' using bipolar transistors
type BC547=2N3904 or 2N2222, W3JHR "Synthetic Rock" shown on pg 145
in Amateur Radio Techniques (G3VA). I've never really understood any
secret in using JFETs in VFO's, JFETs may even produce higher noise,
particularly for XO's

The transistor should be tapped down on the tuned circuit, quite large
capacitors are possible to use at the active ports, it is some
calculations based on forward conductance, a VHF transistor having
small internal capacitances may be better for drift, even a 6K7 valve
may have near 2000pF across anode and grid to ground in an 80m VFO, I
had some theory about it, but it is lost now, was published in Danish
National magazine in 1957.

It is very important not to overdrive the buffer, and input to buffer
should be tapped down on the tuned circuit or an emitter resistor for
lowest possible capacitive feedback, loose-coupled buffers are
misunderstood application

very true, but you might forgot one very important argument,
it is important to screen the magnetic fields from the coil to reach
the capacitor. The capacitor may be electrical excellent, while
magnetic unstable for the magnetic fields which need not pass to it

HAMFEST March 7, 1999 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB & SUFFOLK COUNTY RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - MARCH 7, 1999

On March 7, 1999 the Great South Bay Amateur Radio Club & Suffolk County Radio Club will again sponsor an indoor Hamfest. The location will be at the:

Knights of Columbus
400 South Broadway
Lindenhurst, Long Island, NY

There will be radio equipment, electronic componets, computers and access-ories, softeware, books, technical manulas, ARRL information, Amateur Radio License Exams, Door Prizes. General admission is $6.00.
Free Admission for spouses and children under 12.

VE - ARRL - 12:00 NOON
For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam session. 1999 ARRL/VEC fee is $ 6.45, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

PLEASE NOTE: The VE session will be held at the Babylon Town Town EOC.
200 E Sunrise HWY, North Lindenhurst, NY.

For vendor and additional information pleas contact, Peter Portanova WB2OQQ at(516)541-4886. Email info@gsbarc.org

Talk-in will be via W2GSB Repeater on 146.685 4Z(136.5) PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 pm on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

Yes that HW16! my first rig too, once I called CQ on 15 meters and I got a
call from the shechele islands. I run for clean underware!!!! CT

How seriously do you want to do AM - the who 9 yards with 6L6's and modulation transformers or will double side band be adequate? Reason for the question is that I saw an Analog Devices chip which could, conceivably, be used to generate an AM signal.

FWIW, Many such supplies can be adjusted down a bit with a
trim pot. If not, a minor change in one of the feedback
divider resistors would bring the output down.

2557. Re: Programming info on a uPD861C PLL

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-06 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7bqibu$fag@news.Hawaii.Edu>
Source record: 72838
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.homebrew

John and Chris: This rig has two xtals in the PLL stage - 10.240 and 10.695 MHz. Also, a cross reference says that the uPD861 is almost identical to the 858, if that helps. I would have thought that adjusting programming of the PLL via its ten programming leads would have been a better approach.

Thanks for your help, guys. Got to get on 10m CW ACAP (as cheaply as possible).

On Wed, 03 Mar 1999 05:11:55 GMT, pje@haystack.mit.edu wrote:

Two things are important here:

stability and compensation.

And note: there is no miracle !

Stability includes mechanical stability of all components involved (inductances, capacitors, wiring, tubes, semiconductors, sockets, gear, scale, etc...), electrical stability of the all values of electrical components. That includes the stability of the operation point given by the supply voltages (including the heater voltage of tubes) and the amount of applied feedback. Note that not all similar components have similar data. E.g. there exist ceramic capacitors with a high stability of the values and other ceramic capacitors with very bad stability. Have a deep look on the data sheets. High stability components are marked as being such ones, with data giving exact values of stability.

Because the temperature is not always the same and because all components having any influence on the frequency do not have the same value at every temperature, you have to make a judicious choice in order the compensate the drift of some components by the drift of some others ones. Most components have a positive temperature coefficient because there is a dilation with increasing temperature, which results in higher values of inductance and capacitance because these are depending on the mechanical dimensions. Fortunately there exist few components having a negative temperature coefficient, there are mainly ceramic capacitors. The art is to combine them. Have a look on a commercial oscillator, you will understand what this is. Have you seen all the parallel capacitors ? They cannot easily be replaced by only one capacitor because they have different data.

The oscillator circuit used is not without any importance, but its importance has been exaggerated in many amateur application areas, while often ignoring important principles. Look at high performance commercial oscillators. You will be surprised to see very simple and common circuits. Not without any reason, of course. In few words, a good oscillator circuit is one allowing to get good stability and compensation (as defined here) in the best and most practical way.

And note again: there is no miracle !

Lane:

Best be carefull about those capacitors. Aerovox has been around a very long time, and, prior to about 1975, oil-impregnated capacitors meant Arochlor, Monsanto's polychlorinated biphenyl. Really good for capacitors (and HV transformers), but now an Officially Nasty chemical ranking right up there with dioxin and DDT. Asbestos fibers are mild compared to PCB's. Should somebody make this into a cause, the guys in bunny-suits will want to de-contaminate your house to about 3 feet below ground level.

From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01be6819$217d8d60$a43063c3@default>
Source record: 72843

Twisting makes no difference to characterietic impedance
Ro. Just the same as flat pair of same wire diameter and
same spacing (unless screwed up tight). Twisting reduces
noise pick up from power and other wiring. It also reduces
crosstalk between pairs running alongside each other over
appreciable distances.

Terminating with Ro prevents signal reflections and echos
up and down the line. Reflection of digital signals can be
a serious matter on long lines..

Ro is typically 110 to 160 ohms. A termination of 130 ohms
is as good a value as any.

2563. ICOM IC-R70--Connect to 13.8VDC??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-06 00:00:00 UTC
From: F W Mooney <fmooney@sprintmail.com>
Message-ID: <7brcqq$7k$1@oak.prod.itd.earthlink.net>
Source record: 72844
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Greetings.

I have an ICOM IC-R70, which has no external connection for 13.8 volts dc power. However, internally, there is a jack (J1) which when disconnected, opens the circuit between the internal power supply and the 13.8 volt bus which powers the radio. I'm tempted to try wiring from my car's cigarette lighter jack to this connector to go mobile.

Has anyone out there ever done this? I'm a little concerned about damage due to inadequate voltage regulation, coming off the electical system of the car. Are car electrical systems adequate, or should I put a regulator between the car power and the radio?

Fred,

Your idea has merit and sounds fine!
It would be a good idea to install a fuse in the +12VDC line inside the radio,at the point you tap into the +12vdc.
Also a Diode in parallel with the + and - will save the radio if you make the mistake of hooking the +12vcd backwards.
Your comment of regulating the input voltage may not be important.
You should expect 12vdc to 13.8vdc out of a Car's electrical system.
Measure the voltage on the radios 12VDC line and see if it is at 13.8VDC.
If it is you are all set.
If it is right at 12VCD them you should regulate it down.
The next step would be to find out how much current the radio draws on the 12vdc line.
Find 2 diodes like a 1n4002 that handle the current draw.
each will drop the voltage .7volts when installed in series.
13.8 - 1.4 equals 12.4vdc. Close enough?
That is the cheap way.
A regulator takes a bit more work but and Let me know if you need to set one up.

2565. NSS- Annapolis

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-06 00:00:00 UTC
From: donlewis79@hotmail.com
Message-ID: <xVbE2.1011$Ku1.1002417@newse3.tampabay.rr.com>
Source record: 72846

March 4, 1999 filename: nss0304.txt

Merle Parton,

In case you don't know the latest developments at NSS,
let me update you.

NSS was decommissioned in early 1996. The sole remaining
facility employee is John Schorpp, the antenna man.

The towers and transmitter building are scheduled to be
demolished by September 1999. There has been an
appropriation of $4.2 million to demolish the site and
convert it to a wildlife preserve.

There is a group of people, including John Schorpp, and
now me, who learned of this development only this past
weekend, that want to stop the demolition and convert
the site to a museum of VLF radio technology.

As a member of the Antique Wireless Association, I wrote
a letter to its president last night, citing the few facts I
know, and asking what it might be able to do to aid this
venture to convert to a museum. The AWA operates a
large communications museum in Bloomfield, NY, just
south of Rochester NY. It has ties with the Smithsonian
Institution.

There is a public hearing in Annapolis March 8, 1999. The
time is 6:00 p.m. of the Lowe Office Building. That's all
the address I have. I have handwritten directions to it that
John Schorpp handed out at a hamfest we attended this
past weekend.

John Schorpp has asked me to ask you to consider putting
a notice of this meeting on the NSS Web page. I know
this is short notice, and there isn't even a complete address,
but let me give you my name and phone number: Pete
Sypher, 301-601-2711. I'm going to the meeting. I'm going
to spend time and effort for this cause of converting the
site to a museum, even though the chances of this being
realized are slim, in my estimation.

73, let me know what you think about all this.

Pete Sypher

Contact Icom and they will send you a schematic. That cable has a
level shifter built into the DB-9 connector, 13 components, so
direct wiring will not work. You are looking for a schematic of the
OPC-478

Source record: 72855

Hi all I have just started using p-spice to simulate some small op-amp based circuits. The circuit is a very simple non-inverting amp with a voltage stimuls of 1 v p to p at 1 khz. The output of the circuit is blocked by a 10uf capacitor and terminated in a 47k resistor... The output also contains a bubble or marker titled v audio out so as to display the wave form in probe after simulation... The circuit is powered by 12vdc.

Now to my problem. After selecting the trace in probe the left axis units are in volts but the problem is that it does not display the Wave form correctly. Its like the simulator is not taking into account the dc blocking cap on the output. Hence there should be no dc present on the output waveform but only the ac component which is what I am interested in seeing.

Any ideas on how to acomplish this.....

tia JD..

These are certainly very common 1-amp power diodes; try the 1N540x
series for 3-amp diodes.

And the distance makes me think this is the case.

> The question, then, becomes: given common tools, how does one
> determine whether it is a spurious output from the police transmitter,
> or inter-modulation/overload in the receiver? (overload seems
> unlikely if the transmitter is 2 Km away)

We took the simple, logical approach; since we suspected the interference
was on the repeater input, we tuned our receivers (one on 5/8 wave on the
car roof, one on duckie) to the input and drove around tracking signal
strength until we were close enough for the duckie-equipped receiver to
pick it up. We then looked for towers.

It would have been much easier if we had taken the time to cobble up some
sort of direction-finding antenna, but this was a spur-of-the-moment whim
rather than a planned pursuit. :-)

> Putting some attenuation on the front end (say 10 dB) should eliminate
> intermodulation / overload as the cause, for the purposes of
> troubleshooting. That having been determined, how does one convince
> the local police radio engineer that she/he has a problem (assuming

We thought about that and went straight for the police chief. He turned
out to be cooperative. I'd bet FCC would be responsive if he hadn't been,
because FCC seems to make lots of money on land-mobile fines.

I recently picked up a surplus 90 kW J-band (16 GHz) magnetron and would like to learn more about what's required to make this thing "hum". No, I really don't want to fire this thing up because I still want to have kids! I really want to learn about microwave theory and the engineering required to make equipment like this work. Pointers to reference books, websites, etc. would be greatly appreciated!

Thanks,
Scott KC7MRV

Ya gotta admit, when you mention Herb, all the bravado
and boasting about mighty enforcement teams working
"harder & smarter" suddenly ceases. Even if ya don't
agree with Herb, ya kinda gotta admire the guy. He's
frustrated and held the commission at bay for 25 years!
He's beat them so much to a pulp that they won't even
discuss his case.

Wanna bet he's around for another 25 years?

BTW, we could care less one way or another, but
the guy IS unique in the annals of FCC enforcement!

Hi,
You can use 1N4007, 1000V PIV, 1A for almost any power supplies. For signal diode, it is different, 1N4148 will do for silicon diode and 1N270/277 will do for germanium diodes.

The time constant of your output circuit is 47 ms (47 cycles at 1 kHz). If there's a voltage step happening at turn-on for some reason, it would couple through the capacitor and look like a D.C. offset for quite a while. You could test for this possibility by reducing your R or C by a factor of 10 or more, and extending your analysis to cover several time constants. If that's what's happening, then you have to find the reason for the step.

I never did make a contact on the HW-16. Ended up selling it to an electronics teacher at the local tech college. He got some reports that the transmitter was a little wobbly, despite the crystal, so he set out to add a voltage regulator to the oscillator.

He chose to use a pair of neon lamps in series, reasoning that 62V + 62V = 124V, which was pretty close to the oscillator supply voltage anyway. He did a really nice shunt regulator circuit - series resistor, neon bulbs as the clamp element, and a bypass cap. What he forgot was that when a neon bulb turns on, it doesn't clamp at 62 volts - it fires at 62, but then drops to something like 6 volts until the current drops below some holding value. Which it did onece the bypass cap discharged.

What he'd built was a relaxation oscillator that modulated the crystal oscillator. At the time, Novice operators (like him and me) weren't

allowed to use modulated CW.

Oops.

Dave

John and Chris,
Here's the latest update. The 861 uses six pins for binary-coded decimal programming, but there is an option to use eight pins. That would give 2^8 - 1 channels spaced 10 kHz apart which would give me a 2.55 MHz frequency span* beginning at Channel One - that would easily get the radio above 28.000 MHz. I tabulated the hi/lo voltages on the programming pins for each channel/frequency which enabled me to determine the BCD frequency scheme. I'll bring the eight leads out to an eight-pin DIP switch which I'll mount on the front panel. I'll have to get proficient at base-two counting to determine the frequency of operation!

The RF stages will need to be aligned - no problem there.

So now I'll have a "new" 10m CW rig for free (other than a few hours of head-scratching and soldering).

Moral of the story: No need to change the crystal in the PLL stage.

73, Jeff WH6U

* Some of the channels have greater than 10 kHz spacing, so the 2.55 MHz range is a conservative figure.

Hello,

For most of the tube type Heathkit amateur gear that used solid state
rectifiers (SB series, HW series, DX-60 and HR-10) the 1N4007 (1000 PIV, 1A) is
more than adequate. The only exceptions I can imagine are the linear amplifiers
(SB-200/201, SB-220/221, HA-14). If the amplifiers used strings of diodes,
1N4007s would be a good choice for them as well. If a diode string develops a
problem, it's a good idea to replace all of the components in the string, or
consider a redesign with more modern components. (Diode strings were used
because higher voltage diodes were unavailable or prohibitively expensive).

No, I would think that all you really need to do is supply filament voltage at some large amount of amps and a reasonable amount of high voltage and current. This would provide a CW output of quite some power. What makes things tricky is when you want full power out ie 90 KW, then you have to build the various pulse circiuts. Magnetrons are natural oscilators all by themselves. Have fun. Makes a great paper weight.

An AD9850 will have tons of spurious outputs down 60 dB for the main output. If the intent is to transmit at anything higher than QRP levels a 9850 is NOT the way to go. And for a receiver you will have tons of spurious responses because signals will tune not only at the desired frequency, but at all those other spurious frequencies.

If you want to use 9850 (or any other DDS at current state of the art) you will have to build a PLL to "track" the main output, and strip off the spurs. At least the ones more than a few hundred cycles from the output frequency.

Source record: 72689

Hi Robert,

No, not the same tubes. One of the ones you sent was shot.......the other one was good and ended up in a friends linear amp. These two MAY be NOS. They are RCA's in RCA boxes. They don't look like they have been run much, if any, but the lettering is smudged up on them, so I have to assume they are used.

These tubes came in a large lot from a fellow in Oregon (Ed Billecki). There are a lot of NOS sweeps in it, but my friend usually comes by and wipes me out on them, so I am not sure what else will be coming available. (I let him dig through first)

I have no use for sweep tubes. I only tinker with antique radios and tube audio gear. I don't do transmitting equipment.

I have the following High Voltage Variables for sale, good shape - shipping extra.

Hammond Manufacturing, a pair of 350UFd @ 3000 volts, with 1" Johnson porcelain mounting legs, and a Johnson porcelain inter capacitor connector. Should sell as a set - $40.00.

Hammond Manufacturing, 250 ufd @ 3000 volts, $15.00.

Hammond Manufacturing, 100ufd - 100ufd dual section 6000 volts $40.00

Pair of 100ufd with interconnecting cable from ARC5 transmitter $6.00

New in box Airdux coil, #1604T 2" 4TPI $15.00

In a literal sense yes but not a practicle sense no. You cannot for example use a humam hair to wire a circuit with. It might however, in a very high voltage situation, provide a path of electrical discharge.

Price reduction.......Must sell
I have a beautifully built Sailor HF AMP. This one has two RCA 8122
ceramics tetrodes which checked out full output. 1.8MHz to 30MHz
All the tuning is done with servos and the band settings are set with
brass slugs. Built under high standards, rackmount, very high quality
components including a large cooling fan. It was removed and fully
functional from a cruise ship that went to solid state. This amp puts
out about 800watts with very little input. It has a built on solid
state pre-driver stage which can be bypassed if need to. It's complete
and in excellent condition. It requires a power supply and controls
for the servos. No manual but can be found at marine electronics shops.
Sailor is still the leader in Marine and satelitte communication
networks. I will send jpgs by request to anyone interested. I want
$350+shipped for it. The tubes alone cost that! Roughly 45 lbs

The 1N4001 rated at 1 kV (I think), 1 A seems to work fine in place of all the rectifiers I've come across.

NOT always OK for thermionic diodes, because they provide built-in surge prevention. Just add a suitable series resistance, say 100 ohm 5 watt to experiment with.

NOT suitable for replacing signal diodes, either.

There are 3 kinds of diodes you're likely to find in you Heathkit:
1) Rectifier diodes
2) Silicon small signal diodes
3) Germanium small signal diodes.
For most power supply and rectifier applifations, the 1n400x series are a good generic substitute, as long as you observe the breakdown voltage ratings. For most common small signal applications (detectors, low level switching, etc), the 1n4148 silicon diode is a good choice. For some low level RF detectors, it was common to use a germanium diode such as a 1n34. If the detector was designed for a germanium diode and you sub a silicon diode, you might find that the sensitivity is not as good.

>> And since I've found a way to make
>>PC boards without shelling out $3 a sheet for toner transfer paper, time
>>spent wiring up chips isn't as big a problem.
>
>Do tell. I'm interested.

Well, DynaArt (http://www.dynaart.com) makes a version of the
toner-transfer product, and I suspect they're a great bunch of
engineers that don't know when to stay quiet.

I saw their product in the Digi-Key catalog, and thought it was
probably better than the toner transfer film sold by Meadowlake
(which I had tried with limited success) becuse it used a paper with a
water-souble coating.

I sniffed around their Web site, and they had made the mistake of
saying what the magic coating is. I found a locally available source,
and managed to make my own version of coated paper. I laser-printed a
PCB layout for a 40M CW transceiver on it, ironed it onto a piece of
copper-clad board, and etched it. Worked quite well, although a few
really fine traces and tiny donut pads broke. Easily repaired before
etch with a resist pen, or afterwards with a bit of wire and solder.

Much as I hate to undercut somebody's product ('cause I hate having it
done to me), $3 a sheet seems a bit much. However, I offer these
rationalizations for giving up the info:

1) I got the key info from DynaArt's own Web page.
2) DynaArt sells a much more uniform product, so if qualuty means a
lot to you, then go buy their product.
3) DynaArt sells additional equipment that improves the quality and
reproducibility of your boards even more.
4) Nobody ever got rich selling products to hobbyists, except maybe
George Eastmen.

I've found that mucilage make a usable, water-solube coating for
toner-transfer paper.

I'll leave the details of how to get it on the paper in a usable form
as an exercise for the reader. And if you try to market it, you're on
your own.

>"Nothing better than home-brew, except perhaps an absence of Spam"

Hmmm... my home brew (well, homemade wine, anyway) seems to make Spam
more tolerable. Cheers!

Interesting thread, but.....

How come no one has talked about how to achieve a 150+ dB dynamic range with third order intercept of +30 dBm? _That_ is what makes a good HF rig, not how many MB you have in the processor!!!

Also, in my humble experience (ham for 30 years, engineer for 23 years, masters degree for 10 years) Tab books are traditionally full of mistakes and bad designs, although I haven't looked at any since McGraw-Hill bought them out.

Doesn't the HW-101 have a drive level control?

I used to run the Heath twins (SB series) and they had a drive level
control.
Believe the HW series worked the same.

Just back the thing off to get whatever power level you want.

Don't know about the floppy, but any public library worthy of the name will be able to do a interlibrary loan. If any library in the country has a copy (and is willing to remote-loan it) they will be able to get it for you.

This has been done.

There was an article several years ago in one of the ham magazines (QEX or Communications Quarterly?????) showing how to do this.

The basic idea was that the frequency of the magnetron was dependent on the load impedance mismatch. By injecting the harmonic of a crystal oscillator, by means of a directional coupler, (thereby appearing as if there was a reflected signal from a load mismatch) it is possible to ''phase lock" the magnetron.

As the other posters have said, I would urge extreme caution.

As far as the high voltage is concerned, is it any more dangerous than an HF amplifier?

Actually, the 1N4001 has a PRV of 50volts. I just checked, and the ECG
replacement guide uses 1 diode as a subsitute for the lower half of the
1N400X sereis, and then a different diode for the upper half. They are
substituting a higher PRV diode for the low numbered ones.

But your point is good. The 1N400X sereis are all 1amp diodes, but
as the final number goes up, the PRV goes up.

It is called injection locking.

>As the other posters have said, I would urge extreme caution.

In the 73 Magazine article, a waveguide to coax transition was
used to couple the maggie to the feedline and hence to the antenna.
The oven compartment remained "cold" and housed the injection lock
oscillator and modulator (FM). So the HV was as protected as
when the oven was in normal operation, and the only RF exposure
risk was at the antenna (though that could be substantial).

>As far as the high voltage is concerned, is it any more dangerous than an HF
>amplifier?

No. A tube kW amp is a tube kW amp. The voltages and currents have to be
similar in either one.

Ouch. I'd start small, like a no-tune transverter for 2.4 GHz,
or some Gunn diodes on 10 GHz.

Microwave ovens have serious power transformers - as anybody who
has ever lifted one will know. The connections and insulation are
odd by amateur standards. Most have half-wave rectifiers, since
transmitter cleanliness isn't an issue, but cost is.

One time, an author of a Tab Book, I think it was called "The 6809 CookBook", actually said in a magazine that he didn't suggest people buy the book. Because whatever he had started out with was terribly mangled by the time it made it into book form.

Is Tab even around anymore? I've seen books of recent years from McGraw-Hill that sure look like Tab books, but don't carry the Tab imprint. A couple of books that don't seem clear about who they are meant for, so cover things badly. Photos that are there only as filler. Material that seems to repeat in two places (and I'm not talking about some layout problem). Generic material that just seems to be pasted in. I'm sure I've seen instances of misleading or erroneous material. I can't remember if I've noticed bad layout where photos and diagrams referred to in the text are far from that text. But all of these things are what I'd come to expect with Tab Books.

Interestingly, these books I'm thinking of were at the library. I'm glad I didn't pay for them, but it seems like they could have found better choices from other publishers.

I'm trying to build a small antenna for a hand-held to be resonant at two frequencies and I want it to be short. I have read that you can put two helices one within the other to achieve this. Does anyone have any experience with this? Also, where can I get info on how rubber duckies are constructed. I think that they use a similar approach to what I want to do, and if not then I'd like to see what they do because that's the basic concept I'm after. Any help would be greatly appreciated.

probably a good idea for an FM transceiver, but the most common way
for CW/SSB transmitter is to increase cathode resistor in ALC-
controlled IF amplifier. Unfortunately the drive levels may differ
between SSB and CW, so you may have to reduce gain further for cw
compared to ssb.

It all depends. If you are working at VHF/UHF, and live way out in the
boondocks with no other high-power RF sources around, then -60 dBc spurs
from your LO may not be a problem at all. But move down to 40 meters,
with a decent antenna hooked up to your receiver, and you may change
your mind.

An LO spur at -60 dBc will convert an unwanted 30-over-S9 signal to
about S4, still perfectly readable. This may not be such a big problem
if you use a sharp preselector on the lower HF bands, but combined with
the modern trend toward untuned front ends, you're headed for some
serious grief at -60 dBc.

That's the right attitude. Just don't fall into the trap of thinking
that just because the commercial guys get away with it, it's good enough
for you! Ask any Icom R-1 user what they think about that....

Besides, I think this radio uses the same IF amplifier in receive and
transmit. Decreasing IF gain would have undesirable effects on the
receiver...

Usually such items are designed as low duty cycle radar sources. The
power required is likely to be 10-20 kV at nearly 1 amp. It probably
won't run CW without overheating. Usually the duty cycle is less than
1%. It has to do with the way magnetrons are built, especially the ones
for higher frequencies (like 16 GHz). To switch the power for the tube
usually requires another tube about the size of a table lamp. Be very
careful because the voltages and currents involved are LETHAL!

All my reference books are at work, but you might try the Artech House,
Wiley or Crestone publishing sites for books on the subject.

I've never tried it (and my 101 has been in the attic for a LONG
time...) but you could probably run it with just 1 of the final tubes.
Some of the old rigs got down to the old novice power limit like that.
Try very low drive and see if it will tune. If you have to max out
the tune or load capacitor, stop.

An easier way might be to use the alc jack and put a variable voltage
on it. Control the voltage on the alc jack and you control the power.
The front panel control doesn't do a very good job of it as you've
probably already found...

Yep. They don't talk much about cases that are in the appeal
process, but from reading, that has just ended. Herb lost.

Even if ya don't

2651. Re: Microwave xmitter/oven

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-08 00:00:00 UTC
From: PsyTech@massey.ac.nz
Message-ID: <h0HE2.526$Ch2.50769@news.clear.net.nz>
Source record: 72711

In article <wT5E2.95$wB4.8898@homer.alpha.net>, rude@maqs.net says...
>
>Hello,
>Just wondering...has anyone had experience building a microwave xmitter from
>a microwave oven? Would like to hear from you.

The magnetron of a domestic microwave oven generates RF at a nominal 2.45GHz.
The magnetron along with a HV diode + (approx) 1uF cap form a voltage doubler
(the magnetron is a diode as well). Hence the microwaves are *pulsed* according
to your line frequency. The RF output is therefore full of hash.

>
>Could some one give me an idea as to the voltage off the secondary winding
>of a microwave xformer, say from a 1K oven? (120 volt primary)
>Dave
>rude@maqs.net
>

The transformer delivers around 2kV and is doubled to around 4kV across the
magnetron. This is *extremely* dangerous as it is a low impedance supply. I can
think of no domestic apparatus with a power supply anywhere near as potent.
Treat with the utmost respect - it will show no mercy! To use a microwave as an
RF source you will need to modify the supply to provide a constant voltage and
provide the magnetron with a resonant cavity tuned to 2.45GHz. This will clean
up the RF somewhat although magnetrons are somewhat broad band. Of course such
a transmitter is an accident waiting to happen and should not be built! Apart
from the powersupply hazards anyone straying into the beam is in trouble.
Microwave ovens have safety interlocks for good reason.

If you want to muck around with a microwave source try a (small!) reflex
klystron (100mW @ 10GHz easy) or a power oscillator using a wideband BJT
(10mW->10W @ 1 or 2GHz depending on your BJT).
IMHO big magnetrons are just too dangerous for casual microwave experiments...

Hi there,
I started this thread a few days ago, and thanks to all those who have replied. Later, I'll try to summarize.

In article <36e2a1e1.4997680@news.magiclink.com>,
bcarver@magiclink.com (Bill Carver) wrote:
> An AD9850 will have tons of spurious outputs down 60 dB for the main

> output frequency.
>
> Bill W7AAZ
>

Two questions now:

1) So if 60 dB below the main output is bad, what is good? I.e. what should I be shooting for to have a clean transceive-ready LO?

2) And if one wanted the digital convenience of a 9850 w/out the spurs, anyone have any pointers to a reference for a tracking PLL implementation to clean the spurs up, as Bill suggests? Or is this so non-trivial that we're out of the hobbyist zone, and one should go back to a traditional limited-tuning VFO with a digital stabilizer?

I have a working prompro 8x programmer that I am trying to find either
a M010 module or schematic (even a hand drawn one is great) for.

The M010 does the 27C010 or 27C1001 eproms.

I have the manuals and schematics books for this one here, but this
module isnt shown in them. It only tells how to use the module.

Also if you have a remote keypad for one of these, I'd be interested.

Greetings ....

I have the following for sale:

NATIONAL R-175 R-F PLATE CHOKE. NOS Still in original box.

Specifications: The R-175 transmitting R-F Choke is suitable for
parallel feed as well as series-feed circuits in transmitters of
up to 3000 volts plate supply. If plate modulation is not
employed, the chokes may be applied to transmitters operating at
voltages up to 4000.

The characteristics of the R-175 choke are:

Voltage breakdown to metal base 12,500 volts.
D.C. Resistance 6 ohms.
D.C. Current Rating 800 ma.
Inductance 225 microhenries
Distributed Capacity 0.6 micromicrofarad.

Note: I use two of the R-175's in my Pair 4-1000-A homebrew
Class "B" GG Linear Amplifier. One for each tube.
Works great!

Cost: $18.00 U.S.D. plus $2.00 shipping. M.O./Personal Check.

Quantity: two (2)

If you are interested, please reply via EMail
at: w4ono@citrus.infi.net

Thank you,

I think that the current pulse used to "form" the device results in
impurities in the whisker forming a P-type alloy with the bulk semiconductor
material.

Try the Heathkit Ham Radio Pages of KB9JJA

"http://members.accessus.net/~dwentz/kb9jja/heathkit/"

There is a section that has schematics. I don't know which one
you are looking for but there is at least a schematic for the HO-10
Monitor Scope. I have one of these at home.

> should I be shooting for to have a clean transceive-ready LO?

If the ratio of the simultaneous strongest off-channel rcv sig to the weakest on-channel rcv sig is X dB, the ratio of the LO to the strongest spur should also be at least X dB. For a "good" (define good) ham receiver and for "most" of the time, but not "all" of the time, X is about 80 to 90 dB.

This is not an ironclad rule, because occasionally the signal ratio can be much greater than that. However, in the real world we accept something less than perfection, which would be perhaps 130 dB, and we accept an occasional spurious response. And most of the time the interference is minor.

Also, synthesizer spurs & noise and front-end intercept points (second- and third-order) should be considered as parallel design specs of equal importance.

It's a matter of statistics (how often can you tolerate a spurious response?). With an 80 to 90 dB ratio, the interference is not "serious" (define serious), at least here in Iowa. In Europe or Megalopolis it could be more bothersome.

The tradeoff between cost and performance always raises its ugly head, but nowadays 80-90 dB LO performance at modest cost is not difficult or expensive.

Zero<g>..

Seriously, you can't just remove both 6146s. (though the suggestion that you remove *one* of them will probably work. Do be sure the loose plate cap from the missing tube can't short to anything!) By simply removing the tubes, you open the circuit between the driver and the antenna. A little power will probably leak through stray capacitances & inductances, but if there's enough to work more than a mile, I'd be surprised..

I suppose you could redesign the driver plate tank circuit to drive a 50-ohm load, and probably get something on the order of 5 watts. It wouldn't be a trivial job though. Reducing drive is much easier.

2662. ARRL "Radio Designer" from CAD schematics!

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-08 00:00:00 UTC
From: harp@pell.net
Message-ID: <7c0u1v$9k2$1@nnrp1.dejanews.com>
Source record: 72722

I'm sure this must have been done before, but I haven't found any reference
in DejaNews or elsewhere, so here goes:

(1)
ARRL "Radio Designer" [ARD], a useful tool for simulation and analysis,
won't draw or read schematics. ARD works from a NETLIST written in a
format called "*.ckt".

(2)
Matt Pyne wrote "TinyCAD", modestly described as an "entry-level" ECAD
for W95. It's powerful, easy to learn, and < almost > free. Draw and print
schematics, make PCB art, etc. TinyCAD is GOOD! And, TinyCAD will produce
a NETLIST in its own format (*.net).

(3) Wherefore,
I have written a W95 utility, "Tiny2ARD", which translates TinyCAD
netlists to ARD netlists.

A TinyCAD schematic, drawn with the "ARD" SYMBOL LIBRARY provided with
Tiny2ARD, translates to an operable ARD circuit-description (BLK-END) block.
Tiny2ARD will APPEND individual TinyCAD circuits into BLKs in a single
*.ckt file, or the user can cut & paste at will. Add your own FREQ block
and any other [STAT OPT OUTPUT] blocks and ARD's happy.

(4)
Now I can:
* [TinyCAD] draw a schematic; create a NETLIST (mouseclick!),
* [Tiny2ARD] translate the netlist for ARD with a cupple mouseclicks,
* [ARD] analyze, optimize and tune the circuit.

It's not quite as good as a kilobucks design suite, but it's pretty good!
...and it's CHEEP:

-- ARRL wants USD 150.00 for ARD. (Everybody's already got it anyway.)
-- Pyne would like UKP 10.00 (USD 16.08, today) for TinyCAD, shareware.
(it's the full version, WELL worth it! websearch InfoSeek: +TinyCAD)
-- I ask USD 10.00 for Tiny2ARD by email (~ 100kb.) or $14.00 on disk.

This amounts to a $27.00 add-on to ARD for working directly from
schematics with great ease. SUCH a deal!

Anybody interested in "Tiny2ARD", email: harp<USUAL SYMBOL>pell.net
I can provide TinyCAD, but you'll have to pay Matt yourself.

Yes, I fully agree. Magnetrons are both dangerous and unsuitable if
you want a clean signal. If you want to live dangerous and have fun,
I have this 5J30 in stock. It is capable of an continous output of
some 150 - 500 Watt at 350 - 750 Mhz. It is water cooled!!!

Klystrons are much easier. Try a 2K25, about 50 - 100 mW at 10Ghz. I
have various other types in stock. Also a TWT (Travelling Wave Tube)
2 - 4 Ghz 36dB gain.
Please inquire for all kind of micowave valves.

Hello--

While the ECG replacement you mentioned may carry a 600-volt rating,
the 1N4001 is speced at 50 volts PIV.

Back in the early days of silicon rectifier diode production, low
yields of high-voltage diodes probably made it economical to sell
the low-voltage diodes (1N4001s and 1N4002s) at lower cost.

> should be much less than they currently are, but not completely
> non-existant.

How much more of a sewer and "Alice-in-Wonderland" do you want
both the commercial and the amateur spectrum to become?

> This isn't a very good analogy, because the
> radio spectrum is not comparable to land. Whereas land can and should be
> privately owned, the radio spectrum is and should be public property.

Then why are you applying land ownership/use concepts such as
"private" or "public" "property" to the regulation of its use?

I know that it must inflame the non-professionals for me to say
this, but the professionals have been charged to be the manager
of the resource by the government, which bottom=line is the
representative of our society, and to get a professional job
done. Get out of the way and let them do it.

All naysayers not withstanding, I believe the DDS approach is nearly foolproof and very adequate for all but the elitest contester types who wouldn't have anything less than perfection. At -60 dB spurious response, the performance of the receiver using DDS approaches the published specs of many commercial pieces of equipment. Further, DDS technology is improving very quickly and will soon rival most PLL designs. This Spring Analog Devices will start sampling a new DDS that has quadrature sine wave outputs (great for phasing receiver buffs!) and spurious outputs better than -80dB! For anyone looking to build a homebrew receiver with pretty damn good performance and with minimal effort, this technology is the way to go. I do this stuff for a living, so when I do a homebrew project, I want immediate gratification. Perfection can come incrementally after it's working. DDS is just the ticket to avoid the frustration that inevitably comes with free running oscillators. Don't sell it short.

It is true that the J310 is less expensive than the U310.

However, the U310 can give higher gain, since the metal case allows it to be grounded in a better fashion. I use the U310 in all critical applications, and the J310 otherwise.

>choices from other publishers.

Michael,

You bring up a very good point. Somebody who takes an interest in
radio, or electronics, or some other technical hobby is likely to go
to the public library for information first. Poor information there
will likely turn them off.

The quality of technical books at the average library is highly
variable, too, when you figure that many libraries use volunteer help.
And even the paid employees are likely to be trained in library
science, education, or some other field - hardly qualified to judge
technology literature!

But a local radio club can help a LOT by purchasing and donating
-good- books on the subject. That's how I found the radio club that I
eventually became president of - I was new in town, and went to the
library to find a book on ham radio. (I was already licensed, but
working on a construction project.) The local club had purchased a
bunch of ARRL books, added a label in the front with the club name and
contact info, and donated them to the library.

It's an excellent form of PR for the club, it helps improve the
quality of the collection, and it's a darned sight cheaper than a
hamfest!

My (somewhat small) website contains updates, transceiver improvements and corrections to the book, Build Your Own Intelligent Amateur Radio Transceiver, ISBN 0-07-028264-1. It's http://www.flash.net/~randylh/

I agree that the "radio" circuits are the most important part of the design. The transceiver project uses high-level dual-bridge diode mixers and fairly robust intermediate frequency circuitry. The synthesizer has a clean low-noise output.

I am for the most part, satisfied with the job that McGraw-Hill did in preparing the book. I've received many compliments on its style from people who liked the presentation of basic concepts. It is not a heavyweight on radio theory, or even digital theory. There is however,

enough information in the book and web page for intermediate to advanced experimenters to build a nice multiband, multimode HF transceiver.

I use this rig on several bands on a fairly regular basis (uaually weekends). Lately, I've used SSB more often than CW. I'm most frequently on 40 and 17 meters, Usually with the homebrew 800-watt amp on SSB, barefoot on CW, into an 80-M full-wavelength loop. Feedback on the book or project is welcome. 73

Hi Jim!

Well, homebrewing is all in the eyes of the beholder, isn't it?...
Remember that 1/2 W QRP transmitter with one 74HC240, a crystal, and
about half a dozen passive components?. Absolute simplicity. Pure
cunning. Challenge to operate. Good HF rig? Maybe not by your
standards, but from my vantage point, yes indeed!

150dB Dynamic Range? What a project... if you can do it at all it's a
great HF rig; if you can do it for $50 and a handful of parts, even
better !

Hey Jim!

The ISBN is different, but I wonder if the book you want is:

"Digital Signal Processing : A Laboratory Approach Using Pc-Dsp/Book
and Disk (3 1/2 Version)" (Oktay Alkin)

or maybe:

"Pc-Dsp : 5 1/4 IBM Version (Book and Disk)" (Oktay Alkin)

Both are listed on:

http://www.amazon.com/

Also, just as a tip, I find that I can find nearly any book, new or
out of print, using bookfinder:

http://www.bookfinder.com/

Good luck!

Hello--

Also, try

www.abebooks.com

www.bibliofind.com

www.bibliocity.com

Note that Bookfinder doesn't search all available online book
databases-- in fact, it misses several services listing millions of
books! And, due to search limitations not all copies of a given
book may get listed.

Also, note that in many cases you can save considerable money if you buy
out-of-print books directly from smaller book dealers.

Gday Eamon
I have got the AVR stabilizer circuit going
It seems to work reliably with a 5 MHz VFO. I am working on the user
definable offsets etc software at present. Will get back to you when it is
up and running.

2693. Re: J-band Magnetrons

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-09 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <36E5513D.7602DE9@teleport.com>
Source record: 72668

In a previous life (mid-60's), I repaired long-range search radars including the ones on the DEW line in Alaska. One, the FPS-6 and derivatives, used a magnetron. (Frequency was about 2.3 GHz, about the same as a microwave oven.) The peak output was 4 MW. The power was applied to the tube in the form of a 10 kV, 500 A pulse which was stepped up by an oil-filled 10:1 transformer right at the base of the tube to 100 kV, 50 A. The duty cycle was low, so the average power was a few kW, but those pulses were serious stuff. That's what it took to detect airplanes at 400 miles using 1N21 germanium diodes for a detector.

Source record: 72669

Motorola had a classic app note by Garth Nash that was
about 50 pages on the theory & application of PLLs. It
may be on their we site. They also had a 100 page booklet
called "Phase Lock Loop Handbook" that had general info
and data sheets on the 4024 voltage - controlled multivibrator,
MC 1648 LC VCO, MC1658 VCO, and MC4044 Phase/
Frequency detector.

I have been given a 23 element Tonna for 23cm, the only problem is it doesnt have any instructions and seems to be missing one of its elements.

I was wonder if anyone has the exact length for each element?

Also what is inside the driven element? Could I make new driven elements so I can build copies so I can have a box of 4?

Thanks Anthony (G7LRQ IO91TQ)

Would the same be true for transmitters?
In my QRP transmitter design, I want the oscillator to run from
3 to 30 MHz but it would be asking a lot from a traditional PLL circuit.
I had planned on using a MC14151 PLL and MC1648 VCO.
The AD9850 seemed to be much better for wide band.
Now I am confused.
My amplifier circuit will be tuned but I will be playing with
broadband designs. I don't expect to exceed 25 Watts CW.

The 9850 data shows an AM modulation method as well. Would this
design be good enough for Amateur band use?

This group has been a great help. Thanks.

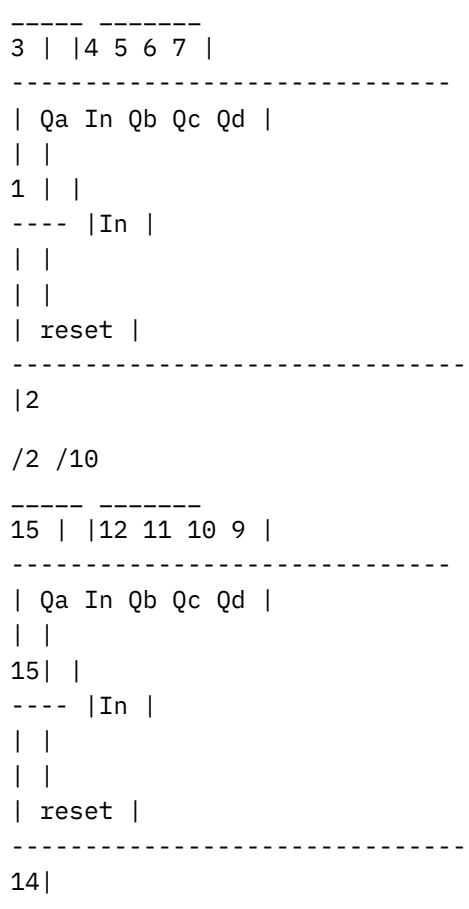
Maybe it's because people have moved on to other things, but I am surprised that the 74LS390 has never gotten too much attention in hobbyist circles. It's a dual decade counter and in effect the equivalent of 2 7490's.



Vcc is of coursepin 16, and ground is pin 8.

The only difference from a 7490, other than packaging, is that the reset input is not as complicated.

As with the 7490, if you want a 50 perccent square wave, you can move the \/2 stage from the input to the output of the /5 stage. It will upset the BCD counting if you've got a readout connected to the BCD outputs, but is no problem when using it as a simple divider.

Source record: 72596

Hello OM,

Your requirements can be met today by building a direct conversion phasing receiver, using AD831 low-distortion mixers for the I and Q channel input mixers.
These can yield +30 dBm intercept with only -10 dBm LO power. See latest issue of
QEX for article. You can achieve 50 dB of opposite sideband suppression, using a
design like the R2 (Campbell, Jan 93 QST), which has been duplicated by hundreds of builders.
The phase noise is dependent on the LO used. A DDS device such as the AD9851 with low phase noise reference crystal oscillator may meet your needs. Or else
build your own very low phase noise analog VFO/PLL synthesizer.
These same building blocks can make a transmitter or transceiver of course. All the audio
(baseband) stuff is can and is being done today with DSP, eliminating the analog audio phase
shift networks.
Not a pipedream at all. At least not for homebrew! For factory built, well, it will take a while.

I predict that this is how all transceivers will be made as soon as manufacturers give
up on superhet designs. It should result in dramatic price decreases.

73 and GL,
Don, W6JL

Date: 1999-03-10 00:00:00 UTC
From: Don W6JL <W6JL@ixpres.com>
Message-ID: <7c6jpg$q0c$1@ocean.cup.hp.com>
Source record: 72597

John OM,
Why, and in what mode(s) do you want to reduce the power? Changing it
from 100W to 25 W is only a 6 dB reduction, an S unit or so, makes very
little
difference in normal conditions. What is the objective?
Doesn't the HW101 have a drive level or carrier insertion level control?
You
can run any output power you want, by inserting an audio signal into the
rig, and
adjusting the level for any desired output power, same as with any SSB
transmitter.
Do a little reading up of available documentation and info and you may
well find
you don't have a problem to solve!

Message-ID: <7c6l6rsfd1@cletus.bright.net>
Source record: 72599

I would like to change the old FET (a 3sk40) on my 2M front end to a gaasfet (such as a BF981) to try to lower the noise floor. Any one know of a source for the BF981 and what would the bias differences be? This rig also uses the 3SK40 in the mixer and I wondered if I might gain anything by changing it to a gaasfet also but can't seem to find any references to using one in that configuration. Any experiences or ideas?

Back in the heyday of Electronics Illustrated, Jim White (W5LET) wrote a series of construction articles for simple transmitters. One of them was for a 40/80M rig with a 6L6 final. Over the intervening 25 or so years I have acquired most of the parts, but alas! I have lost the article with the plans. Anyone remember that article (it's not the one with the parts nailed to a piece of plywood!) or have a copy? I would sure love to put together this anything-but-state-of-the- art xmtr.

Thoughts, suggestions? Please reply directly if you would.

Tnx & 73,
Bob

2720. Frequency counter circuit required

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-10 00:00:00 UTC
From: David Cunningham <D.L.C@btinternet.com>
Message-ID: <7c6te0$qg5$1@plutonium.btinternet.com>
Source record: 72603
Cross-posted to: rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I need a circuit for a frequency counter, covering a range of about 500kHz
to 30MHz, for amateur radio use, preferably using TTL i.c's.
I intend to use it for measuring the frequencies of vfo's, local
oscillators, etc. The circuit should preferably be as simple and inexpensive
as possible. If anyone can help by suggesting a suitable circuit, please
email me.
Thanks.

2728. Magnet wire vs plastic insulation

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-11 00:00:00 UTC
From: Shawn Upton <supton@eece.maine.edu>
Message-ID: <36E7FF0A.167E@eece.maine.edu>
Source record: 72528

I tried building the radios on the Homebrew is gud 4 u websight a while back, but the radio never worked. I used some cheap wire that I had, who knows what kind it was (red and black, if that helps). Is there a huge difference between using magnet wire and other stuff? And if there is, is it because of insulation having a high dielectric?

IMHO, the current prices for low-end freq.counters
is such, that it is cheaper to buy a new one, than to
get the parts and build one, not even counting one's time.
(If using one is the end product, and not the experience gained
building/designing it).

Paul OM,

What noise figure do you have now? What noise figure are you
requiring?
Do you have a calibrated noise source so that you are able to measure
and adjust the
new device for min NF? It is not just dependent on bias; it is also
dependent
on input impedance matching to make the device look into a source
impedance
that is optimum for noise figure. Note that this is not generally the
same
as maximum gain. If you are using FM, you may not notice any
performance improvement by lowering the noise figure, since FM is not
a useful weak-signal mode (10 dB threshold penalty).
If any of these questions or comments are new or unexpected to you,
you may first want to do a little studying on noise figure, how it is
measured,
and what noise figure you need for your application. This could save
you
a lot of work, yielding no discernable practical improvement.

This explains, of course, why you just don't see plans for
certain devices (2m FM radios are another that comes up in this
newsgroup all the time) in the amateur press anymore.

For fun, I just had a look through a well-known distributor's
catalogue (Digi-Key) for the prices on a 1970s-style frequency
counter. Not only are the prices on the chips scary (and you
still have to wire them up!), you end up with an inflexible,
power-hungry counter that will only count to 30 MHz or so.

Surplus Sales of Nebraska has the Collins-type turret tie points. Don't know if
that's what you're looking for,
but it might be close:

http://www.surplussales.com

also, there are a lot of old Tek tube-type scopes on the market, and they can be
had for CHEEP -
I paid $50 for a working 80MHz 500-series scope recently. You might buy up some
old broken ones and
tear them down for parts...

good luck and 73,

Jim OM,

Dynamic range seems to be one of those favorite words lately. Sort of
like "halogen" and "laser" was to the average consumer in the '80's.
You might ask yourself what good is 150 dB of dynamic range? Do you
live next door to a 100KW transmitter? I would expect that you are
unlikely to ever detect any difference in daily use between a receiver
with 110 dB of dynamic range, and 150 dB.
I almost never encounter signals over 10 mV (80 dBuV) at the receiver
input. Do you? That is 40 dB over S9, assuming 100uV RMS = S9. The
difference of an s9+40dB signal and a barely detectable signal at say
0.3 uV on 40M CW (is your QRN level less than 0.3 uV on 40M?), is
[20*Log(10mv/0.3uV)] or about 90 dB. If you switched in a 20 dB

attenuator in the front end, you increase the receiver's dynamic range by 20 dB, and reduce the MDS (minimum detectable signal) by the same amount. So now you could only hear a 3 uV signal (still above your QRN level on 40M?).
The real need for dynamic range is when attempting to copy very weak signals in the presence of nearby VERY STRONG signals. While I find myself copying weak signals a lot (I'm a CW op), I almost never do it in the presence of 40 dB over 9 adjacent signals. Your QTH and operating style may vary...
So it is good to keep in perspective what these numbers mean in practice. Not doing so makes you a good high-yield target for marketing hype by manufacturers of ham radio equipment.

Be careful though. A few years ago (I don't recall the year but believe
it was in a December issue) Electronics Now (or maybe it was before the
name change in which case it would have been Radio Electronics) had a
"1GHz Frequency Counter" that probably would have had problems getting up
to 5MHz. The uathor was a little confused on the concept, and for some
very odd reason it slipped by the editors.

It was a straightforward counter, probably using the Intersil 7208 or more
likely a later variation. But the author put dividers ahead of it to get
a higher count. Two or three decade counters if I recall correctly, so
the mid-HF range of the LSI frequency counter IC could be extended to a
much higher frequency.

The problem was, the author used plain old 4017 CMOS dividers as the
prescaler, and there was no way that they could count any higher in
frequency than the LSI counter.

To compound the problem, last year in the Q&A column someone asked about a
frequency counter, and they were pointed to that same article. Luckily,
someone sent in a followup letter, as there were when the article was
originally published, pointing out that there was no way the thing could
count very high.

So be sure to avoid that particular frequency counter article.

The BF981 is a dual gate Mosfet. I used one as the RF amp in
my H/B 2M rig. The 3SK88 is a similar device.

Magnet wire is used inplace of copper for the reduction of harmonics
and self oscilations in amplifiers. Magnet wire is used instead of
copper in band switch operations and feeds to the parsidic chokes in
amplifiers. this helps the chokes from passing VHF frequencies.
I hope this helped you

I understand that you may really want to build your own, but if you
change your mind, I have a couple of Hewlett-Packard counters that are
excellent and affordable. They also offer a degree of quality that you
are very unlikely to match.

These are both modular sets that use an upper half that houses the
reference clock and the display, and a lower half that houses the
counter electronics. The two halves lock together, but can be swapped
quickly if you wish to change counters. They are AC line powered.

HP5300A: 6 digit display module with an internal clock that is
accurate to better than 1 part per million. $40.

HP5301A: 10MHz frequency counter with .1, 1, 10 second gate times and
adjustable sensitivity. $20.

HP5302A: 50MHz counter/timer, with same gate times, but also does
period, period average, time interval, etc. $60

Shipping CONUS, $5, or buy all three and I'll pay the shipping.

Magnet wire IS made of copper. It has an enamel insulation
coating which is very thin allowing more turns per square inch
in motor and transformer windings. If you are making small
coils the insulation should not make great deal of difference
as long as you have the correct number of turns.

Magnet wire is simple copper wire with an insulated enamel coating. It's probably called magnet wire because it was originally used to wind electro-magnets. If you wind RF coils with copper wire using a different insulation you will likely end up with a different inductance than what was intended due to the different dielectric properties of the insulation and different turns spacing due to the added thickness of the insulation. How much difference this will make depends on the circuit in which it is used.

I agree completely. I built a counter myself using a 7216 chip and an 11C90 prescaler. It worked fine for a while until oneday one segment is dead on all the LEDs. The 7216 chip somehow developed a short in the pin driving this segment on the LED. Later, I found a handheld counter at a Radio Shack stand at a hamfest. It was brandnew and was on sale for only $39.95. It counts up to 1.3GHz with quite good a sensitivity. It has a LCD diaply (although not very high quality) with backlight and the metal case provides very good shielding. It even have a switch for NiCad battery charging.
In my opinion, I would spend my time and money building other stuff like QRP rig or something more useful rather than building a counter or a DVM.

Hello--

Seconded. I bought an HP 5334B 100 MHz universal counter for $195 postpaid from Pacific Test Equipment; the instrument's sold as used but appears new and includes an operations manual copy. No way could I even deam of building such a versatile instrument for that little money.

The 5334B offers time-interval, period, rise and fall time, ratio (it has two input channels), start/stop and accumulate operations. There's even an HP-IP port. ALso, there are math functions (frequency offset included).

PTE is at (408) 441-7341 and usually advertises in Nuts & Volts magazine.

Disclaimer: I don't work for PTE and have no interest in the company; I'm writing only as a satisfied customer.

Sorry for quoting you, Monty, in spite of your request. Your comments made me curious, so I did some checking.

The limit for unlicensed operation of an intentional radiator in the HF range is a field strength of 30 uV/m at a distance of 30 meters. At 30 meters from and broadside to a 40 meter dipole in free space, you hit the maximum allowable field strength at a power of 186 uW. This is 44 dB below 5 watts. If you wanted to be on the safe side, you'd add another 6 dB to account for ground reflection. Of course, any antenna gain over a dipole also increases the field strength.

Roy Lewallen, W7EL

Hi Don!

If I read you right, what you're suggesting here is a receiver with
instantaneous dynamic range of 120dB or more. I thought you were
going along great gun until you started digitizing stuff:

1. Phase noise aside, spurs generated in DDS VFOs like the AD9851 are
only 80db down at best (typically 70dB). Doesn't this mean that an
unwanted full strength signal at the input is likely to convert to an
equivalent spurious signal at 30-40db (above MDS)?

2. DSP can (at best) resolve only signals that can be digitized. At
16-bits A/D, that means a theoretical maximum dynamic range of 96db,
or 85-90db real world. You can AGC that around, but that's not
instantaneous dynamic range.

> Not a pipedream at all. At least not for homebrew!

Because of the conditions in which 'ducky-type' antennas
are used, the dimensions, eg, former diameter, height,
number of turns, wire gauge, dielectric constant and losses
of shrouding plastic material, the connector, are very
uncritical. Just as much depends on the dimensions of what
is held in the hand, is it sweaty ? the size of the case,
than on the antenna.

The resonant frequency and load on transmitter, or
impedance presented to receiver, vary all over the shop
depending on whether held at arms length, close to the head
or left lying around on a wooden table or on a metal car
bonnet.

Make one. Does it work ? Yes ? Fine ! Repeatability
- don't worry about it.! Make a million of them all just
like that and make yourself rich.

Source record: 72615

Keep in mind a DDS does not make ONE spur, it makes many, MANY spurs. Ilive in rural Idaho and an AD9850 makes lots of spurs I can hear on a receiver. Some are very close to the main carrier, but they can be tens of MHz away too. Selectivity in LO generator (not just a generic lowpass filter) and on the antenna helps.

A receiver spur is my own business. Someone who puts a -60 dBC transmitter on the air (remember, MANY spurs) is asking for a hassle from anyone who lives in the same, or nearby town 'cause those spurs will be all up and down the band.

DSP is instant gratification. Like a roll in the hay with someone you met in a bar, it is not necessarily something you want to live with (NOTE: no sexes were named, it works either way!). One QRP article says "if you hear a spur, tune to the same pitch on the other side of zero beat". Personally I don't care to make rigs that do this. Making a tracking PLL is time consuming., as is making a temperature compensated analog VFO. It's a choice you get to make: more work for better performance.

Analog Devices specifies a "close in" spur level and they are nowhere near 80 dB at this point. Quadrature outputs with SFDR of 80 dB would make a GREAT image-reject product detector.

Bill Carver wrote:
> Keep in mind a DDS does not make ONE spur, it makes many, MANY spurs.

This is all shocking to me. I've never had time to play with DDS yet,
but the reading I've done has always suggested low distortion levels
(which suggests to me low spur amplitude) with a little filtering.
National Semi's AN-263 suggests 0.5% distortion at the DAC output, and
0.1% after filtering; I just have trouble visualizing 1/1000 of the total
amplitude, spread over several spurs, producing spurs only 60 dB down.

It seems so tempting to go direct to a sine wave; but it's beginning to
look easier to filter the square wave.

> Analog Devices specifies a "close in" spur level and they are nowhere

AN-263 suggests 6 dB improvement per additional bit; maybe that's the
big secret of the newer chip. (I can't find the reference I could swear
I saw to a new chip from A/D. I wanna play with that chip.)

Be advised the homebrew duplexers at the site below are NOT
Bandpass-reject but Bandreject only...(or notch!)...
MOST commercial two way sites NO LONGER allow such use..
they require the BandPass-Reject type to minimize out of
band RF noise and reduce the possibility of intermod...
UHF duplexers are much easier to build.....
but temperature stability is a big issue...use of Invar as
the main tuning component is a MUST...and you must know how
to use a lathe, etc......and BE CAREFUL....Invar is not a
"clean" metal to use...it does have health issues!

You can build a duplexer out of PC Board...look for an old QST on
PCB duplexers in the late 70s or early 80s...I have the article
available in TIF file format to send if interested....
just email me direct for the request...I will not post it
on the NG...

I need the Sams manual for a President Grant 40 channel SSB CB.
I have access to a large commercial copier, so what I'd like to
do is borrow your original manual and copy it myself. I promise
to treat it with utmost care, return it to you promptly, and pay
the postage both ways. Our local library doesn't have any Sams
manuals, and I don't have the time to to the Dallas or Fort Worth
libraries, plus I'm not a member of either. Can someone help me
out here? I'd like to get this radio working properly so I can
convert it to 10 meters.

You could try one of the newer devices such as the Siemens CF739 (?)
This device is relatively cheap and has excellent noise performance
Try http://www.imaxx.net/~kd9jq for some excellent articles on homebrewing
- in particular some on GASFET amplifiers with matching network software

Hello
Has anyone replaced the 2N6456 finals in the Heathkit SB104 with the MRF455A's. They come in the same case style. After looking at the MRF455A they have the same characteristics. The differance between MRF455 and the MRF455A (NTE334 and NTE333) is the case style. The price is the only other differance, and that is a big differance. Does anyone have a diagram of the MRF455 in push pull. I was looking at the Palomar 255 amp and it has two MRF455 what appears to be in push pull but the amp comes with no diagram. I would of bought the thing for the diagram. I would like to know what the base resistor to ground would be with the 455's in push pull,and what the resistor going accross the two push pull circuits would be. The base resistors going to ground with the 2N6456 are 10 ohms and the resistor connecting the two push pull curcuits is 100 ohms.
Thank you for reading

Thanks for the reply and I will check it out. I've also received a number of replies informing me that the BF981 is not a gaasfet. I recently read an article about replacing 3SK40's with BF981's to reduce noise and not finding the specs for either device I assumed it must be a gaasfet to acheive the results stated. I was wrong. I would like to try this mod on an Icom 245 to clean up the front end a little. The 245 uses 3SK40's for the preamp and mixer.

You can use this link to search past issues of Popular Electronics and Electronics Now. They have published many articles on constructing frequency counters. You'll then just need to find a local library that has the issues or can get them through inter-library loan.

TTL is neither "simple" nor "inexpensive" - not in 1999, anyway.

Why not check out some of the microcontroller-based counters instead?

Message-ID: <36E7FFB4.2781@eece.maine.edu>
Source record: 72627

I recently bought a used HTX-202, and it really hates being near computers. My FT-50 is not affected (if you turn the squelch off, the noise does change, the S-meter indicates more noise but "real" signals are not wiped out by the noise, and just turing the squelch on takes care of hte problem). I really haven't done extensive testing on it, but if I recall, it seemed to even lose strong signals (from a repeater) from just being in the same room as the computer, and it was affected by the computer some 20 feet from it! Is this radio known for this, or did I get a dud?

That's interesting, and something I've never encountered. Consider Belden coax types 9659 and 9240. Both are RG-59/U type cable, and are virtually identical except that 9659 has a stranded center conductor and 9240 has a solid copper-covered steel center conductor. The attenuation specifications of both are identical from 50-1000 MHz. (9240 loss is slightly greater at 10 MHz, and quite a bit greater at 1 MHz, presumably due to significant current penetrating into the steel.) This agrees with my experience that, at least well into UHF, there's no significant difference in loss between solid and stranded wire of equal outside diameter.

On what do you base your statement that multistrand wire has high losses at RF, and how does it explain the similarity between the coax cables?

Received wisdom (!) about woven strapping having high loss at RF... I know I've read it somewhere, but sitting here I can't think of a reference.

I did not know there was any coax that had a stranded center conductor!

I should not have said "I know" -- at most I should have said "I have read". (hangs head in shame)

Needless to say, if you've got measurements and I've got hearsay, my money's on you.

On the litz wire front -- why is it not recommended for winding RF coils? Or am I wrong here too?
Perhaps there's simply no advantage to litz wire at high frequencies, rather than actuall lossiness.

Should have posted to boith at once.
Shame on me.

Anyone got a few good 1S5 tubes in the Junkbox?

I'll swap a copy of an article for a little battery
regen SW RX that uses a pair plus a ceramic
socket for the 1st stage tube plus a pair of
small variable caps that may be close enough to use
for tuning and BS. Caps do not have bearings but
hey, a little conductive grease and the BS
made small enough and it will be workable.

These are 1V low current and are supposed to run nicely
on a D cell for A and 4 or 5 x 9V batteries, stacked, for the B

Spoken like a true man of science. We all should strive for this attitude.

> On the litz wire front -- why is it not recommended for winding RF coils? Or am
> I wrong here too?
> Perhaps there's simply no advantage to litz wire at high frequencies, rather than
> actuall lossiness.

Litz wire is a different animal than ordinary stranded wire. In Litz wire, the strands are individually insulated from each other, and at least in some cases, they're interwoven in a random-seeming pattern. This has some advantages at low frequencies (MF and below), where the currents can follow individual strands. At higher frequencies, the current just flows on the outside of the whole bundle, so it doesn't make much difference whether or not the strands are individually insulated. At these frequencies, the interweaving might cause more loss, as the current has to keep traversing from one strand to another to stay on the outside of the bundle.

It's true that braided coax shielding causes increased loss at very high frequencies. I don't know where this first becomes noticeable, but suspect it's no lower than UHF. (If Tom Bruhns is reading, maybe he'll comment. He should know.) Just the other day I had occasion to measure the loss in some RG-58 and some 0.141" semi-rigid (solid copper shield) coax at 6 GHz, and the RG-58 was much lossier, despite its larger size. I'm certain this was primarily due to the braided shield. And I wouldn't be surprised if stranded wire has more loss or at least some interesting impedance effects at frequencies where the twist period is a sizeable fraction of a wavelength. This is well into the microwave region for most wire, however.

In the June '98 QST there is a neat looking idea for a regen receiver by Dan Wissell, N1BYT. I was surfing the net and came upon someone with a kit to construct this, but I've lost the URL. Anyone know who/where this kit is? I thought it was Dan's Parts (http://www.fix.net/dans.html) but its not there now.

Dynamic range is, loosely defined, the ratio of the strongest signal that can be handled (everyone has their own idea of what that means) to the weakest signal that can be recovered. Putting an attenuator in doesn't improve dynamic range, it merely shifts everything up x dB. The only two things that can improve dynamic range are better overload performance, or better weak signal performance. If either of these comes at the expense of the other, dynamic range hasn't been improved.

The transmit RF power anplifier is designed to operate satisfactorily and withstand all possible adverse conditions due to very near proximity, or not, of foreign objects including the user. There's a huge safety margin to ensure reliable communications with hand-held gadgets.

Shifts in dimensions and materials due to normal manufacturing variability have an insignificant effect compared with variations due to the environment when in use.

In short, manufacturers couldn't obtain a non-repeatable design even if they tried. The RF PA designer gets the credit for equipment tolerant to abuse - not the antenna manufacturer.

db (voltage/current) = 20 log V1/V2

for 0.1% (0.001) distortion (distortion is just the ratio of unwanted
signals to desirable signals), then,

db = 20 log 0.001 = -60db

Not bad for music synthesis, but not too great for weak signal
detection in a wide dynamic-range ham receiver.

Hi Zorn!

IMHO, DDS's are excellent for QRP transmitter designs. FCC Rules
[97.307(d)] state that for transmitted signals below 30 MHz, spurious
responses must be at least 40 db down, but they relax that to 30 db
down for output powers of 5 watts or less.

These are very reasonable goals. A 5 Watt QRP transmitter with
spurious responses 30 dB down has 5mW of spurious output. At 60 db
down, 5 micro-watts. [10 log P1/P2] Unlicensed transmitters can
operate with 15mW (don't quote me). There are tens of thousands of
incidental radiating devices with these kinds of transmitting levels,
contributing to a general rise in broadband noise floor, especially in
urban areas. And the average class B computing device probably is
somewhere around 1 mw of lotsa spurs... of course, you don't hook your
computer up to an antenna... hi... unless you consider the power line
an antenna ;-\ I hate to think what an average TV radiates, but you
can frequently hear in it the HF bands in metropolitan areas.

Keep in mind that the FCC is talking about aggregate levels of
spurious emissions, not a single spur, while the DDS manufacturer's
are touting the levels of any one single spur. Nonetheless, for QRP
transmitting, your AD9850 will do admirably, with plenty of spurious
"margin", and no harm will come of it.

>The 9850 data shows an AM modulation method as well. Would this
>design be good enough for Amateur band use?

I'll leave this to someone else...

The point is very well taken, Don; it's hard to imagine anyone would need 150dB dynamic range in a ham application, but I could be wrong. But I will take issue with your figures. In a metropolitan area in close proximity to other ham stations (and sometimes out-of-band stations apply also, since many receivers have fairly broad front end circuitry), it's not unheard of to see 0.1 - 1.0 V of RF at the receiver input. In a rural area, your cheapo Direct Conversion receiver with 75 db of dynamic range will do just fine 99.9% of the time.

> If you switched in a 20 dB
>attenuator in the front end, you increase the receiver's dynamic range
>by 20 dB, and reduce the MDS (minimum detectable signal) by the same
>amount. So now you could only hear a 3 uV signal (still above your QRN
>level on 40M?).

This is a common misunderstanding. Lets take an example. Without the attenuator, lets say the largest signal your receiver will handle before spurious effects or overload takes place is 0.1V (for arguments sake), and it's MDS (Minimum Discernable Signal) is 1 uV. This is an instantaneous dynamic range of 100db. [20 log V1/V2]

Now lets put the 20 db attenuator in. -20 db represents a voltage ratio of 1/10. Now overload takes place in the presence of a 1.0 V signal, but the MDS has also been raised by that ratio, to 10uV. This is an instantaneous dynamic range of 100db. [20 log V1/V2]. The dynamic range hasn't changed.

Then what's the sense of having an attenuator? Well, if the signal you were trying to copy was 10uV, and there was simultaneously a

nearby signal of 0.5V, that signal might cause the receiver to overload, typically causing some kind of distortion. If you then apply 20 db attenuation, the desired input signal is attenuated to the equivalent of 1 uV, and the nearby strong signal to 0.05V, below the level that causes distortion. I find this most helpful on 40M at night, when the euro BC stations are SOOoooo loud. But for weak signal work, this is no fix at all, because the attenuator raises the equivalent MDS, making weak signals disappear.

> The real need for dynamic range is when attempting to copy very weak
>signals in the presence of nearby VERY STRONG signals.

Well said!

>While I find
>myself copying weak signals a lot (I'm a CW op), I almost never do it in
>the presence of 40 dB over 9 adjacent signals. Your QTH and operating
>style may vary...

I guess you never work 40M novice band at night... I do, on occasion.

And in Europe, watch out!

Price reduction.......Must sell
I have a beautifully built Sailor HF AMP. This one has two RCA 8122
ceramics tetrodes which checked out full output. 1.8MHz to 30MHz
All the tuning is motorized and the band settings are preset manually
Built under high standards, rackmount, very high quality
components including a large cooling fan. It was removed and fully
functional from a cruise ship that went to solid state. This amp puts
out about 800watts with very little input. It has a built on solid
state pre-driver stage which can be bypassed if need to. It's complete
and in excellent condition. It requires a power supply
No manual but can be found at marine electronics shops.
Sailor is still the leader in Marine and satelitte communication
networks. I will send jpgs by request to anyone interested. I want
$350+shipped for it. The tubes alone cost that! Roughly 45 lbs

I know that I should not be pushing this one, but Ericsson Components AB, Upplands vasby, Sweden have 14.000MHz crystals as a stock item for about US$3 per piece plus postage. Dunno about postage price though. I know because i jave just bought a couple myself for testing, since I am also seeking 14.100MHz crystals. If you have no joy and decide to have some made then perhaps we could put in a joint order (it's a lot cheaper to order several than just one) together?

If you want to "go it alone" with getting them ground then "Quartslab" in Erith, Kent, England will make crystals to your spec. I cannot remember the on-line URL but you can find it from the "suppliers" chapter in my homepage (http://hem2.passagen.se/sm0vpo).

best regards Harry

If you really have to build one, the circuit in the ARRL handbook works and it shouldn't cost more than $20 to put together. You can learn something about display drivers etc. by looking at the circuit.

I have a "formerly" expensive HP model that I purchased used, and a radio shack portable model. Interesting, the RS model will interface a PC and it was about $80 when I bought it and they are a lot cheaper now. It's a matter of whether you want to invest time or money.

I have no way of measuring noise figure so I have to assume that a design works in practice as it is designed in theory. I designed a preamp with the CF739 and the software mentioned above - it seemed to work as predicted with regard to gain and output. In this case I was aiming for good headroom (+12 dBm out) for a repeater receiver. I couldnt find a source of BF981s they are out of production now so I understand. The CF739 (?) is a SM device and quite small but I have found these are easier than thru hole now.

Adjusting PK-232 LED display...

Hi.

I am looking for the method of adjusting the LED display on
my PK-232.

For contesting I will be using a HAL P38, just installed,
(gives much better performance). But..... The onscreen
tuning bars are much more difficult to align quickly than
the PK-232 LED display. So I am feeding audio to the PK for
tuning purposes only.

The PK-232 display shows the 'on frequency' position about
20-25 hz higher than the HAL P38. Want to adjust the PK
display to match. Any gurus out there that can tell me how
to move the PK display frequency center?

Thanks.

For sale - add shipping:

EICO 753 transceiver for 80, 40 and 20m SSB, AM, CW. Excellent
appearance.
Includes EICO 752 AC power supply for 120 V AC operation, all
opriginal manuals etc. Needs two 7199 tubes available for $9.00 each
and a small replacement speaker for the power supply to get it on the
air. $150.00

Heath DX-60 with HG-10B with manuals - excellent shape. 90 Watts CW
and 60
Watts AM on 80, 40, 20, 15 and 10m. A few nicks on top cover of DX 60.
Front panel is very good. VFO looks like new. With all cables etc.
Will sell for $175.00 or best offer.

Small HF Transmitter with 6146 final and Internal Revenue 5735 kHz
crystal, with four small Thordarson transformers, apparently using
Screen
modulation. Missing outer case, but chassis intact and looks to be in
good
shape. Plug-in coil final and has antenna relay, typical RFCs etc. No
manual, untested
Will sell for only $20.00 as a parts / historical rig.

Lafayette 99-2503 Grid Dip Meter - brand new in box and unused!
All original. Great little GDO, with all coils, case etc. $40.00

DRAKE TV-1000-LP Low Pass Filter 30 MHz 1000 Watts $27.00

B&W T-R Switch, 110V AC using 6AU6 tube and SO-239 connectors. Will
sell for $40.00

2 posn. antenna switch with SO-239 connectors $15.00

Wall transformer, 120V AC to 14 V DC 500 mA - $6.00

Yaesu FT-840 HF transceiver. Includes original manual and microphone,
DC cable etc. VLF through 30 MHz with 100 Memories. SSB, AM, CW, RTTY
etc. 100 Watts output. Has two additional filters worth $120 each,
for wide AM and narrow CW. The 6kHz AM filter is essential for
listening to Shortwave broadcasts, hams on AM etc. All band tranmsmit
enabled. In mint condition.
Will sell for $600.00

National TMK-50 Variable capacitor New In Box $15.00

Plate variable transmitting capacitors:
50 pF 800V Hammarlund 1.5" deep, 1/4" shaft, clean used $5.00
140 pF 1000V 1.5" deep 1/4" shaft New, unused $8.00
200 pF 1000V 3" deep 1/4" shaft clean used $6.00
250 pF 1000V 2" deep 1/4" shaft clean used $7.00
400 pF 800V Brass plate variable KS-8221, 3" deep used clean $5.00

250 pF 2500 V transmitting capacitor 154-9 by E.F. Johnson
1/4" shaft measures 2" X 2" X 6" Brand New $20.00

Loading Capacitor - 5 Section, each 400 pF for a total of 2000 pF.
Great for transmitter or linear amplifier. 3" X 2.5" X 6.0" deep.
3/8 diameter shaft. Brand new and unused. $18.00

Loading Capacitor - 2 section, each 500 pF. With 3/8 in. diameter
shaft $5.00

Modulation Transformer UTC Model S21 unused, classic. $50.00

Collins 20 Watt Modulation Transformer, unused classic. $40.00

Thordarson transformer - THORDARSON D161916
power transformer 120 V AC primary potted, square - has two
secondaries:
Sec 1: 5.78 H, C.T. 48 ohms - gives 700V c.t. at 250 mA (24 + 24 ohms
DC)
Sec 2: 23.6 H, 605 ohms - gives 1580V at 20 mA (605 ohms DC)
Approximately 4.5" X 4.5" x 4" Good for about a 180-200 Watt plate
supply.
Will sell for $20.00

UTC choke Model PA104 $15.00
This Inductor is a 18 Henry job with a tap at 14.4 Henries.
99 ohms series resistance It's large - like 5" X 5" x 4"
Good for a choke input filter on a nice sized 200 Watt plate supply.
Will sell for $20.00

Fujitsu Color Printer Model DX-2300, Low miles(!)
This is a dot matrix prinbter, but made very well, and in excellent
condition. Uses tractor feed or single sheet plain paper.
With manual - only $25.00

Books:

1981 ARRL Handbook, excellent condition ONLY $8.00

Television For Radiomen, by Ed Noll. 340 pages, illustrated
1962. Front cover torn a little but otherwise very good $3.00

TV SICK? Service your own TV, by Belmont TV Co.
33 pages, plus sale flyer, 1975 MINT $2.00

METHODS OF TEACHING SHOP AND TECHNICAL SUBJECTS by Leighbody & Kidd
College text, 201 pages, excellent condition $3.00

All four books for $13.00

COMING SOON: More Parts for the Glowbug Homebrewer!!

Charles -
I know what I use - a metal lathe. You need one with a lead screw and change gears that allow you to cut threads in a piece of metal. Then make a simple tensioning rig for the toolpost, and chuck up the form that you are winding the coil on in the lathe. Set up the lathe to cut the number of threads per inch that you want turns per inch (or cm, etc) in the coil and fasten the end of the wire to the form. Make sure the lead screw is feeding the right direction. Then setup your tensioning gadget (several easy ways to do this) and feed the wire thru it. Turn on lathe. Wind wire on to form until the length of the winding is what you want. Stop lathe.

For tension, you can use a pair of rubber wheels and a spring to pull them together, or any of a number of other things.

I realize this will make little sense unless you are familiar with machine tools, but a visit to any local machine shop will get you an expanation of my message.

If you do lots of coils, probably worth getting a small lathe of your own.

Best 73's

Rocci OM,

I stand corrected; I was really referring to the overload point of the
receiver being increased if you add attenuation at the input. I realize
the dynamic range of the receiver has not changed. However, many times
in a strong-signal environment, it is an acceptable tradeoff to increase
max signal handling ability by shifting the dynamic range of the
receiver upward, using an attenuator. At least, in the rare situations
I have encounted it, it works well for me.

73,
Don, W6JL

> http://www.dirtball.com
Oris OM,

You have confused magnet wire with nichrome wire. Magnet
wire is simply copper wire with enamel or formvar or such insulation.
For HF and low VHF, there is essentially no difference between using
enamel insulation and bare or tinned copper when winding small
inductors, antenna wire, etc.
Nichrome wire has very high RF losses (high resistivity at RF),
and is useful for making broadband parasitic suppressors in HF
amplifiers, as Richard Measures has pointed out.

73,
Don, W6JL

2807. Air Coil Winding Software Program

Hello!

Does anyone know where I can download a DOS (or windows) program to automatically calculate how to wind coils for a specific inductance? It would be great if it provided the option of wire size and/or actual conductor diameter (for large tank coils). Even better would something that took VHF considerations into account. Please reply directly to me. TIA and 73, Lance

One thing that noone's mentioned, but might be crucial, is that magnet wire is enamel coated SINGLE STRANDED copper wire. I bet you used wire which is multistranded. I know that multistranded wire has high losses at RF frequencies -- this may be why the circuits you built did not work.

Of course, if you did use plastic insulated single strand wire, my theory's totally out the window.

good luck, and 73

I second the comments of Don, W6JL. Read up on noise and get access to the right test equipment if you still wish to do this. Just building it and tuning for max gain won't give the min. nf. If this is for FM you will never notice the difference unless your rig is from the 70's.

I've heard it said that tinned copper wire is a poor choice for RF coils because of the skin effect. That the "skin" is the lead-tin and not the copper, and the effective resistance is higher.

Stranded wire is used in some RG58 coax, so it shouldn't be a problem in RF work.

2816. FM Monitor

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-13 00:00:00 UTC
From: maddog@io.com
Message-ID: <36e9fa57.3510804@news.io.com>
Source record: 72499

Hi Gang!

I recently had problems with my 2 Meter HT's transmit audio quality, probably for a long time, until someone had the courage to mention it. This led me to think about easy ways to monitor FM modulation.

What I'd like to build is a simple "hands-off" monitor that would demodulate the HT's (or mobile rig's) local RF, without having to tune it. This is easy as pie for an AM rig, a simple untuned diode detector will do it handily, but what about FM? All the FM detector circuits I looked at require some kind of tuned circuit, i.e., they only work at one frequency (usually, an IF).

An added side benefit of such a circuit would be "sidetone", which would aid one in maintaining consistent modulation levels (ever notice how some people talk too loud into the mic, causing distortion, and some undermodulate and sound weak, because they can't hear themselves? sidetone is a natural way of taking care of that problem). Seems to me an additional possible benefit might be the ability to quantify the deviation, perhaps with a meter or LEDs.

Gotta be a way, doncha think?

Thanks, Roy!

Would you mind giving a quickie mini-tutorial on how to go from
radiated power to field strength, for a simple case. Are there some
quick rules of thumb?

Also, doesn't it seem odd that FCC allows hams spurious outputs at
30dB below 5W, (and antenna gain not even in the equation), yet
unlicensed radiators have to be 44 dB down. What do you suppose is
the philosophy behind that decision?

Thanks for the feedback. I always consider your contribution to this
group to be invaluable.

Most of the Analog Devices data sheets (off their web site) plots
typical spectra for their DDS products for different clocks and output
frequencies. Of course none are ever exactly what you want, but it's a
start.

It's not so much the spur amplitudes as much as their location: in,
around, above, below.....everywhere there are little spurs of some
sort and unlike harmonics it is difficult/impossible to filter them
out. For example, Ulrich Rohde in QST used DDS reference for a VHF
oscillator, and ran it though a 10.7 MHz crystal filter to clean it
up. Still had spurs 80 dB down.

Most of these spurs are "high order", and sometimes you can track them
down. Like 13 x the clock - 53 x the output frequency = spur. As such,
they usually "tune" really fast. So these little "tweets" run through
your receiver passband 53 times as fast as the desired signal tunes.
So for receive, if you choose, you can kind of ignore them a lot of
the time. Kinda like having gnats flying around your hamburger while
you try to eat. Transmitting?....now you're exporting your gnats to
other picnic tables.

Body handling: Binary attachment payload not displayed: atomski.vcf

Hello,
does anyone know where can I download a good program for
calculating the strip line coils and capacitors. I'm pretty much
involved in the "above 1 GHz" projects, lately. Making coils out of
ordianry wire isn't actually an easy job. So, I'd like to give it a try
with this software.

THANKS IN ADVANCE!!!

>

That reminds me... there is a simple trick to tune a preamp for minimum
NF by listening to a very weak carrier in FM mode. At the threshold
level of the FM detector, the noise quieting is very sensitive to the
signal/noise ratio (not simply the signal strength) so it's quite easy
to hear when the preamp is optimized.

80 dB xmit spurious is plenty good enough by more than 20 dB for a 1500 W xmtr, according to FCC HF regs.

See ARRL HB.

Future expected tightening of the regs in next few years will still not come close to 80 dB.

>
> Bill W0IYH

I believe a practical answer to this question is that if we inspect the sidebands, out-of-band distortion products and phase noise of the xmit sig or the rcv sig, the DDS spurs can be relaxed to perhaps 50 dB until spurs become dominant. For SSB, for example, 3 or 4 kHz would probably be good enough.

Outside that band, 80 dB would be desirable. 80 dB is "excellent" for xmit and "pretty good" for rcv.

For a CW mode the cleanup PLL bandwidth (xmit or rcv) should be equal to the bandwidth of the CW filter in the typical rcvr, say 200 to 500 Hz. Interference would not be exactly zero but it would be very good statistically.

If both xmtr and rcvr do this there would be very little trouble.

Too much perfectionism does not seem to be necessary for a "high" quality radio. Radio manufacturers know when to stop perfecting and consider other realities. The advantages of a synthesized LO are a big factor that forces compromises in other areas.

The DDS is certainly not the simplest approach, compared to a low drift, low noise VFO, and for many homebrew persons, simplicity may be very important. The VFO may be simple and old fashioned, but it is still a good approach for homebrew.

The resistivity of an alloy of tin and lead (solder) is about 10 times greater than copper. Never use tinned copper wire for winding high-Q tuning coils. Solder is OK on circuit boards and circuit wiring - it eases manufacturing processes.

Silver has only a slightly lower resistance than copper. Its not worth the cost of silver plating copper wire. To prevent tarnishing with age, use enamelled copper (magnet) wire.

Litz wire loses its usefulness above about 2 MHz. It works only when each individually insulated strand has a diameter less than the skin depth in copper. So for HF it becomes prohibitively expensive to manufacture. Reasonable coil Q is attainable by using solid or tubular conductors at 3 MHz upwards.

> problem in RF work.

It's true that tinned wire has higher RF resistivity than copper. For example, you'll find that RG-58A/U (tinned center conductor) has higher loss than RG-58/U (bare copper center conductor). At 10 MHz, RG-58/U has a specified loss of 1.2 dB/100 ft. while RG-58A/U is 1.4. (I've found specified losses to be conservative, so you might find more or less difference in practice.)

In coax, the center conductor is the major contributor to loss, so its characteristics are most important. I don't know what "tinned" wires are typically plated with. The DC resistivity of pure tin is 6.6 times that of copper, resulting in an RF resistivity of sqrt(6.6) = 2.6 times as great if the plating is at least several skin depths thick. Tin-lead combinations will be more resistive than this.

Sorry, but I don't have a mini-tutorial on radiated power-to-field strength at my fingertips. If you're far enough away from an antenna to be in the far field, it's a fairly simple calculation for a simple antenna like a dipole. In the case I gave of 30 meters away from a 40 meter dipole, you're kind of on the edge of the far field. But there are indeed some rules of thumb. I recommend getting a copy of Ed Hare's _RF Exposure and You_, published by the ARRL. (The copy I have says $15 -- a bargain.) It gives the relevant equations as well as a wealth of background information. Since all U.S. amateurs are now required to calculate or measure the field strengths they're producing, it's a topic we all need to get better acquainted with.

I develop and sell EZNEC, an antenna modeling program. Among other things, it does near-field analysis (which actually is a total-field analysis). So naturally I used it to come up with the numbers I gave in my posting. You can also use MININEC, NEC-2, or programs based on these. EZNEC or other programs can also be used for determining compliance with the FCC field strength requirements.

The limits for part 15 (unlicensed) operation are in terms of field strength, while amateur transmitter spurs are in terms of watts from the transmitter. The relationship between these limits will be different for every type of antenna. The antenna and tuner frequency response, as well as its gain at the operating frequency, will affect the ratio. For example, your transmitter could generate spurs which are very much worse than the FCC limits for amateur transmitters, and thereby be illegal, but if they're attenuated by the transmatch and poorly radiated by the antenna, the radiated field could be a long way below the part 15 limits. Or, close-in spurs to a high gain antenna could radiate a field well above the part 15 limit while being within the amateur transmitter spur requirements. I suppose that the FCC established the two sets of limits and measurement methods to make it easier for hams to determine if they comply. If amateur limits were in terms of field strength like part 15, you'd have to test your station like they do for part 15 -- run actual field strength measurements over a large frequency range. And you'd have to do it with each antenna, and when operating on each band -- or on several frequencies in each band. (Part 15 devices are restricted to a single, fixed antenna, and generally operate on a single, fixed frequency.)

The FCC rules are complex, so I'm not surprised that they're not entirely self-consistent. The job of trying to correlate the requirements for spurious emissions for all cases for all services would probably not be a good way for them to spend their limited resources.

It doesn't look like any of the several other responses are answering your question, so I'll take a stab at it.

The ARRL program is a limited version of Super-Compact, which is an industry standard frequency-domain modeling program. I personally feel that the interface could be more intuitive (this comment applies to Super-Compact as well, whose interface is identical), but the program is very powerful and a terrific bargain for the money. I don't know of any program which comes anywhere close to its capabilities for anywhere near the price. I suspect that anyone calling it "trash" doesn't have an appreciation for its capabilities.

I'd also recommend getting the demo version of PSpice. It's a time-domain oriented program and is likewise very powerful. And it's free.

I haven't tried those, but any basic DB mixer will work fine as a frequency doubler if you feed the LO and RF inputs in series, which is easy to do on most mixers because there is no common ground. It is helpful to put a series resonant tank (Q=3 or so) in series with the input. Don't forget to put a shunt choke across the IF output to prevent DC rectification.

:
: Advantage is you can double without tuned circuits.

Apparently it works with the trigonometric equation sin(x) * sin(x) =
1/2(1-cos(2x)), in which a DC component and a sine wave at double
frequency and nothing else is produced. However, this requires that a
linear four quadrant multiplication is performed between the inputs to
the multiplier. The Gilbert cell mixer (used e.g. in NE602 and 1496)
must be driven at much lower levels (compared to mixer operation) to
stay in the linear region. With constant noise level, the SNR of the
produced signal will be degraded, which can be a problem if the
produced signal is used to drive a mixer in a high dynamic range
receiver.

The other way to use a double balanced mixer as a frequency doubler is
to drive the other input into hard saturation with a square wave (or
overdriven sine wave) and input a clean sine wave into the other
input. Essentially this is a voltage controlled full wave rectifier,
in which the negative sine half cycle is multiplied by -1 and the
positive half cycle is multiplied by +1, producing the absolute value
of the input sine wave. The sensitivities of the two inputs in various
Gilbert cell mixers are different, so by suitably setting the input
level, the other input will saturate, while the other input operates
in the linear region, even when the same signal level is at both input
terminals.

With a diode ring mixer used as a frequently doubler, the LO signal
should be strong enough to fully saturate the diodes (-1 and +1 gain),
while the RF input should be low enough to avoid distortion.

: Peter Bolch wrote in message <7cdbe6$k34$2@news.netcologne.de>...

: >do have frequency doublers (e.g. MiniCircuits SKY-2R) a considerable
: >advantage over double balanced mixers ?

I haven't seen internal diagram of this component, but apparently it
is some kind of full wave rectifier which is similar to the one used
in power supplies. Looking at the specifications for other Mini
Circuits frequency doublers, it appears that the input power range can
be larger than for DBMs. However, the prices seemed to be much higher
than standard SBL-1 style mixers.

The full wave rectified signal has quite strong even harmonics output, he 4th being only 12 dB below the second, so some sort of filtering is usually required, as it is also required when using diode ring mixers or Gilbert cell mixers as voltage controlled full wave rectifiers.

You have had lots of replies but I will add mine anyway.
Counters are a bit more expensive in Oz so I might be inclined to build my
own.
Look at Elektor UK Jan 1998. There is an article by Eamon Skelton
describing a PIC micro based counter which is quite simple. As a bonus it
will stabilize a free running VFO with a PLL "huff and puff" circuit . It
uses 2 chips (74HC series) as squarer/prescaler and the PIC itself does
most of the work and drives a cheap LCD display (about US$20). The only
other chips are a regulator and opamp for the PLL if you choose to use
this. Of course you will have to buy a programmed chip and a PC board from
Elektor if you want to do this.
I have a similar circuit using the Atmel AT90S1200. I have got a prototype
going (it works!!) and need to tidy up the design to allow user definable
offsets (up to 8 selectable offsets which can be user programmed using
pushbutton switches). It also has automatic lockup (ie no switch to lock).
If there is interest I might be able to get a batch of boards made. I would
envisage the controller/PCB together would cost about AUS$40. E mail me if
you are interested.

Richard

What little repeatability they might get no doubt involves expensive tooling and machinery which is outside the realm of ham radio unless you run into some ham here in rraa who is in the commercial ducky business, most likely a JA or an HL. Or I expect that you might get the answer via one of the HT manufacturers who in turn might point you to their antenna sources, at which point you might be told that such info is proprietary.

In the final analysis dissect a ducky and talk with somebody who knows what's up with manufacturing.

>Roy Lewallen, W7EL

First, let me state that I haven't actually *used* the ARRL's
limited version of Super-Compact. The primary reason
is my understanding that it doesn't do non-linear, only linear
simulations. This is a limitation that had caused me to not
spend the $150 for the program.

Spice, on the other hand *does* do non-linear analysis
and seems to meet most of my needs.

A fancier, more capable program is Eaglewage "Genesis"
from, surprisingly Eagleware :-) It's a lot more expensive
than ARRL radio designer, but a lot cheaper than Super-Compact.

If you budget is limited, there are *free* Spice packages out
there for the WIN32 environment ... check the web with a search
for "free Spice" or "CAD tools", etc. and you should find several
to choose from.

I will second Roy's comments. I was waiting in line when
ARD was announced. The original version had a few bugs and
minor deficiencies, some of which I reported to ARRL. Dave
Newkirk was then the "guru" and somewhere along the line he
suggested that I talk to Ulrich Rohde, President of Compact.
I was very pleasantly surprised that Ulrich took my phone
calls and agreed to some of the changes that I suggested.

Version 1.5 fixed the problems, although, I was dismayed
that, because I had an "old copy" of v1.0, I was expected to
pay for the "ungrade" that corrected the problems that I
reported. This minor problem was worked out, however.

Unfortunately, Newkirk left ARRL and I believe gone to work
for Rohde, who has since sold Compact to ANSOFT, so further
support for ARD is problematic. Jon Bloom at ARRL is in the
support role there, but the future life of ARD is
questionable. There was a ARD reflector, but that's gone
bye bye, as has the QST column, "exploring rf."

Still, for 150 bucks, it's a bargain.

Disclaimer: The foregoing is my opinion and my recollections
of past events. Time and an increasing feeble mind may have
altered the reported events. <g>

For Sale:
(Add shipping costs to all prices unless stated)

ARRL Handbooks:
1955, 1958, 1965, 1969, 1973, 1975, 1978, 1981 at $10.00 each
All in good to excellent shape, plus one re-bound 1955.

IRS Antique transmitter?!
Small HF Transmitter with 6146 final and Internal Revenue 5735 kHz
crystal,
with four small Thordarson transformers, apparently using Screen
modulation.
Missing outer case, but chassis intact and looks to be in good shape.
Plug-in coil final and has antenna relay, typical RFCs etc. No manual,
untested
Will sell for only $25.00

Lafayette 99-2503 Grid Dip Meter - brand new in box and unused!
All original. Great little GDO, with all coils, case etc. $40.00
(SOLD??)

Lafayette 99-5020 Capacitance Substitution box - like new $10.00

Lafayette 99-5021 Resistance Substitution box - like new $10.00

DRAKE TV-1000-LP Low Pass Filter 30 MHz 1000 Watts $24.00

2 posn. antenna switch with SO-239 connectors $15.00

Plate variable transmitting capacitors:
50 pF 800V Hammarlund 1.5" deep, 1/4" shaft, clean used $5.00
140 pF 1000V 1.5" deep 1/4" shaft New, unused $8.00
200 pF 1000V 3" deep 1/4" shaft clean used $6.00
250 pF 1000V 2" deep 1/4" shaft clean used $7.00
400 pF 800V Brass plate variable KS-8221, 3" deep used clean $5.00

250 pF 2500 V transmitting capacitor 154-9 by E.F. Johnson
1/4" shaft measures 2" X 2" X 6" Brand New $20.00

Loading Capacitor - 5 Section, each 400 pF for a total of 2000 pF.
Great for transmitter or linear amplifier. 3" X 2.5" X 6.0" deep.
3/8 diameter shaft. Brand new and unused. $18.00

Loading Capacitor - 2 section, each 500 pF. With 3/8 in. diameter
shaft $5.00

Wall transformer, 120V AC to 14 V DC 500 mA - $6.00

Heavy-duty footswitch - brand new with AC cables m/f $15.00
(SOLD??)

Brand new SHURE 514B Mobile Mic in Box - sharp-looking. $15.00
(SOLD??)

MFJ-564 Precision Iambic Key Paddle in excellent condition. Chrome
finish with clear red paddles. $45.00 (SOLD??)

Heath DX-60 and HG-10B with manuals - excellent shape. 90 Watts CW and
60 Watts AM
on 80, 40, 20, 15 and 10m. A few nicks on top cover of DX 60. Front
panel is excellent.
VFO looks like new. With all cables etc. Will sell DX-60 for $85.00
Will sell mint HG-10B for $60.00.

EICO 753 transceiver for 80, 40 and 20m SSB, AM, CW. Excellent
appearance. Includes EICO 752 AC
power supply for 120 V AC operation, all opriginal manuals etc. Needs
two 7199 tubes available
for $9.00 each and a small replacement speaker for the power supply to
get it on the air.
$150.00 (SOLD??)

Yaesu FT-840 HF transceiver. Includes original manual and microphone,
DC cable etc. VLF
through 30 MHz with 100 Memories. SSB, AM, CW, RTTY etc. 100 Watts
output. Has two additional
filters worth $120 each, for wide AM and narrow CW. The 6kHz AM filter
is essential for
listening to Shortwave broadcasts, hams on AM etc. All band tranmsmit
enabled.
In mint condition, very low mileage (!) This is one excellent radio
for the money.
I love it but apartment life forces sale. Will sell for $600.00

Kenwood TM-261A VHF FM transceiver for 2m. 50 Watts output. With
manual and microphone.
(The mic needs a new PTT switch available from Kenwood for $1.75)
otherwise in
perfect shape. $175.00

Stancor ST-202A transmitter - a classic rig for 10m AM mobile
operation. Original case and
in very good condition. Includes repro manual and appears to be a
very, rare item
normally only seen in the old magazines and handbooks. Will sell for
$50.00
(SOLD??)

Tube tester I-177B in excellent shape. Case was painted red and needs
to be re-done, but front panel and interior in good operating shape.
With manual.
Will sell for $70.00 (SOLD??)

National TMK-50 Variable capacitor New In Box $15.00

Modulation Transformer UTC Model S21 unused, classic. $50.00

Collins 20 Watt Modulation Transformer, unused classic. $40.00

Thordarson transformer - THORDARSON D161916
power transformer 120 V AC primary potted, square - has two
secondaries:
Sec 1: 5.78 H, C.T. 48 ohms - gives 700V c.t. at 250 mA
(24 + 24 ohms DC)
Sec 2: 23.6 H, 605 ohms - gives 1580V at 20 mA
(605 ohms DC)
Approximately 4.5" X 4.5" x 4" Good for about a 180-200 Watt plate
supply.
Will sell for $20.00

UTC choke Model PA104 $15.00
This Inductor is a 18 Henry job with a tap at 14.4 Henries.
99 ohms series resistance It's large - like 5" X 5" x 4"
Good for a choke input filter on a nice sized 200 Watt plate supply.
Will sell for $20.00

Fujitsu Color Printer Model DX-2300, Low miles(!)
This is a dot matrix prinbter, but made very well, and in excellent
condition. Uses tractor feed or single sheet plain paper.
With manual - only $25.00

Books:

1981 ARRL Handbook, excellent condition ONLY $8.00

Television For Radiomen, by Ed Noll. 340 pages, illustrated
1962. Front cover torn a little but otherwise very good $3.00

TV SICK? Service your own TV, by Belmont TV Co.
33 pages, plus sale flyer, 1975 MINT $2.00

METHODS OF TEACHING SHOP AND TECHNICAL SUBJECTS by Leighbody & Kidd
College text, 201 pages, excellent condition $3.00

All four books for $13.00

Hallicrafters Manuals:
HT-46 $8.00 each (repro)

Is it some relationship between actuak NF and 10 or 20dB quieting at
certain input levels?

jim@rst-engr.com (Jim Weir)
shared these priceless pearls of wisdom:

->
->Anybody got a site where there is a demo, crippled, or otherwise "play
->around" version of the program

I really do wish, just once in these ham NGs that I could get an answer to
TFQ. No, I've played with Spice. No, I've seen Eagleware. No, I don't
want to teach senior level engineering programs to freshmen. And I sure as
hell don't think magnets are going to help them.

The question: Is there a playaround version of ARRL Designer available?
Plain, simple question.

I have found some of these excellent 6B4G valves. 6C4C in Russia is
equivalent to 6B4G and it looks identical to the old Sylvania 6B4G
with double anode stapped together by a metal plate, not the type with
two separate anodes. The 6C4C valves is very well built and give you
an impression of high quality. It is unlike the new Sovtek 6B4G which
looks like a scaled down Sovtek 300B with a single anode.
E-mail me if you are interested.

Best regards,

Hello.
I need informations about building a NOAA satellite 137 MHz antenna (For instance "Turnstyle").
I am currently designing a special receiver for a project in university.

Please give me details about the construction (schematics and measurements welcome !!)

(Sorry if my English is not perfect, but ... I am French.).

You can either mail me at: ----->scan7705@my-dejanews.com
or:
----->fan_de_piercings@hotmail.com

Please DO NOT reply in the newsgroups please, because I will not be able to read messages, unless on saturday or sunday, at home ....

MANY THANKS IN ADVANCE . . .

From: worley@47hill.com
Message-ID: <36EC3D12.4B9F@47hill.com>
Source record: 72461

I have at least 20 ea. 22 volt 2.4 amp transformers in plastic case, with jack for computer type ac cord (120V 60Hz input). About 4" cubed, 3.5 lbs. each, unused mint condition, $3.75 each or 4/$14 or 10/$30 plus UPS. 36330 zip.(Alabama) Can be used with a rectifier and appropriate sized cap to power 28 V filaments, or as is for 21 V or 24 V sweep tube filaments. Also good for 24 V power supply. NOTE: Please REPLACE the "47" with "snow" to make "snowhill" or call 334-347-5281 day/eve/wknd.

Well, some kind of relationship must exist, but it will involve the
characteristics of the FM limiter/detector as well as the system NF.

The point about using a very weak carrier is that the relationship
between quieting and signal/noise ratio is very non-linear in this
region, so it's easier to hear any improvements you make.

I am selling a pair of Amperex 5867A VHF transmitting triodes. I have posted pictures and more info on my ï¿½garage saleï¿½ website at;

http://members.aol.com/Reactor001

If youï¿½re interested, please contact me by email at <OvrReactor@aol.com>.

Thanks,
Tom Mitchell

2881. FS: 7189A tubes

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-14 00:00:00 UTC
From: ovrreactor@aol.com-nospam
Message-ID: <19990314160457.11170.00000608@ng-fu1.aol.com>
Source record: 72465

I am selling a matched quartet of GE 7189A tubes. They are NOS/NIB, and the boxes are like new. They spent a day on my burn-in bed prior to testing, then they were operated at full power before the parameters were checked. Each was tested with 250 V on the plate, 250 V on the screen, plate current at 45 mA. Hereï¿½s the specs on the tubes;

Tube 1 ~ Eg1 = -7.15 V / gm = 11.06 mS
Tube 2 ~ Eg1 = -7.17 V / gm = 11.06 mS
Tube 3 ~ Eg1 = -7.27 V / gm = 11.04 mS
Tube 4 ~ Eg1 = -7.37 V / gm = 11.02 mS

$60 for the set, shipping included. US 48 only, please.
If interested, email me at <OvrReactor@aol.com>

OR, check out these two items I have posted on eBay. There is NO RESERVE, and I started the bidding at $1. These auctions end at around 7:00 PM Pacific, Monday 3/15.

Five (5) RCA JAN 7189A tubes;
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=76766343

and

Three (3) GE JAN 7189A tubes;
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=76769555

Thanks,
Tom Mitchell

2882. List Of Stamp Applications [990314]

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-14 00:00:00 UTC
From: cjX@hth.com
Message-ID: <36ec272b.10121637@news.buller.se>
Source record: 72466
Cross-posted to: comp.robotics.misc,comp.home.automation,sci.electronics.misc,rec.radio.amateur.homebrew

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially
Guy Gustavson's story (see #001) about how he saved his beloved cat
Kesha gave me the inspiration to start writing L.O.S.A. I hope Kesha
still is alive and having a great life. Now 3 years later there are
130+ applications described and I hope you will enjoy reading all
(or parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

1.2 List of contributions

> = Indicates a new or updated application since last time.

001 Robo-Cat

Okay. Sorry to have put you into data overload. Must be
tough doing all of those VP things and having to read
newsgroups too. Now that we understand how busy you are, the
succinct answer is yes. It costs $150 from ARRL. Buy it
and you can play to your heart's content.

This is true when using braided (woven) wire for grounding applications. If
the wire
becomes oxidized, the skin effect losses soar.

>I did not know there was any coax that had a stranded center conductor!
>>
Best reason is that the stranded coax center conductor will survive being
used
on a rotatable antenna system.

From: Rod Kirkhart <pratch@postoffice.pacbell.net>
Message-ID: <36EC4192.A8325B46@postoffice.pacbell.net>
Source record: 72472

Basically, if you take the ring quad out of a double balanced mixer and preplace it with a bridge quad and terminated the IF port in 50 ohms you have a doubler. Just drive the LO port with the fundamental and you'll get your 2F at the RF port (plus 1F,3F,4F...etc).

Source record: 72473

Have three 4-125s (one Eimac & 2 Pentas). Picked up a home brew HF amp
several years ago from a SK estate. Was going to fix it up but lost
interest...never started. Has burned pedistal choke and sloppy solder
connections. Had a pair of 4-125s and a spare. Nobody could tell me the
condx. of tubes. They look good and don't rattle. I have no way to test
them. I have reason to believe at least one is good....maybe all three!
Based on circumstancial PROBABALITY. Unless Murphy's law is in full
effect here. Then these words are meaningless.
If you have a device that uses these tubes, make me an offer over
$35.00.
Gotta start some place.

Delete "X"s from e-mail address to reply.
Tnx

Hi,
I'd like to know if packet radios to navigate on the net are reliable and
legal.
Would it be expensive to use such device?
What are the performances ?
Which devices do I need ?
What are prices for components needed?
Would it be legal to set up a sort of network for such thing?
Thanks,
Gabriele Betti

2897. Turning a single-ended DC Supply into a Duel-ended one

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-15 00:00:00 UTC
From: wb5agz@dc.cis.okstate.edu
Message-ID: <7chu6j$dn1$1@sunhub-tulsa.onenet.net>
Source record: 72332

I am looking for a cheap way to turn a single-ended unregulated wall transformer output in to something that looks like a dual-ended power supply for powering op-amps. I could use a charge pump and get +- supply but this is an audio project and I can stand to use + and - half the full supply voltage and I am not sure I can stand the crosstalk from the switching circuit that might show up. What I am thinking of is using one op-amp set to unity and driven at its positive input from a resistive divider. The output of that op-amp would be the common or zero-reference point of the rest of the circuit. I have a hand full of 741's but I am wondering if there are any chips that are actually optimized for such service. There won't be much current involved at all, but I don't get much more than 50 to 100 mills out of the wall transformer so I don't have any to waste on a low-value resistive divider. My ref output needs to look like a solid ground like one gets out of a true dual-ended supply with the positive and negative voltages taken between it and the positive and negative leads of the DC wallwrt.

well, best of luck, but i still say you would be hard pressed to build your own for less than the $95 bucks it takes to get a ten tec transverter. you should have no problems with it if you can turn the 840's power down to a couple of watts. use that to get on the band and get some experience, then look into homebrewing some other stuff if you like. good luck! 73's.

If you can find a wallwart _transformer_ (without rectifier bridge and filtering capacitor) you can connect the AC output to a voltage doubler producing +V and -V voltages for op-amps.

The "cold" end of the transformer secondary is simply your 0 V reference voltage.

Then connect two half wave rectifiers to the "hot" end of the transformer secondary. One rectifier has the anode connected at the hot end of the secondary and the cathode to a filter capacitor (other end at 0V), this is your +V output. The other rectifier is connected with the cathode to the "hot" end of the secondary and the anode to a filter capacitor (other end at 0V) and this is your -V output to the op-amps.

The op-amp power consumption is so low that half wave rectification is more than sufficient. With large filter capacitors and the relatively high internal impedance of a typical wallwart transformer, at startup, it takes several cycles until full DC voltage is reached, but both the positive and negative voltage will grow at the same rate, keeping their half point voltage close to 0 V, avoiding any large op-amp output swings at startup.

(If a switcher is used to make the negative voltage, the negative voltage starts to grow only after the positive supply is large enough to start the switcher, which may cause a large voltage swing at the op-amp output).

>
>Where might I find crystals for my 40 M QRP rig?
>I need 7.10 MHz and 7.11 MHz.

Call JAN Crystals at 1-800-JAN-XTAL. Get their free catalog. I've dealt with them for over 20 years and have always been happy with their products and their customer service.

C-W Crystals is still in business also. Check in the Ham-Ads in the back of any QST magazine for their ad with phone number. I've seen other crystal ads in QST lately also.

By the way... the QRPers hang out on 7040 KHz (for those with General or higher licenses). I'd avoid 7100 - 7110 KHz because of packet radio. If you're stuck in the Novice band, go higher in frequency to avoid the packet racket. Choose your crystal very carefully so you don't end up on top of a shortwave broadcast station. Do some listening in the evening and find the clearest spots, then order rocks for those spots. Or... upgrade to General and join the serious QRPers down on 7040 KHz!

I had used solid strand stuff. It sounds like I screwed up the coils
with either the dieletric of the insulation, or (due to my inexperience)
wound the coils wrong. (I threw 'em out a while ago, so I can't see how
they were wound.)

Thanks for all the replies; I learned about a few new things from this
discussion!

Theoretically you could have a 'direct conversion' FM receiver.

What I am thinking of is a wide range phase locked loop covering, for example, 144 to 148 MHz. The point that is normally connected to a reference oscillator would instead go to an antenna, perhaps with some gain stages. It would then lock on to the strongest signal. Gain would have to be such that the strongest signal would be yours.

The control voltage could then be amplified to recover the audio.

There are a lot of details to be worked out, and most likely a few 'gotchas' lurking in the background.

I also remember seeing an idea for a wide band FM demodulator that used nothing but pieces of coax. The basic idea was to split the signal with a power splitter. This was followed by two pieces of coax whose lengths differed by a quarter wavelength at the frequency of interest. Finally the two signals were subtracted from each other, which resulted in the FM being demodulated.

Hi,

I'd like to know more about packet radios in Italy or abroad.

>OSU Center for Computing and Information Services Data Communications Group

it is easy using uA741, 4-5 resistors and two smaller power transistors (like 2N2904A and 2N3053). The op-amp is voltage follower with a voltage divider between + and minus rails dividing the voltage into two equal, fed to noninverting input of op-amp, output to ground and pin 7 goes to base of the PNP transistor, pin 4 to NPN transistor, collectors to ground, emitters to +V and -V , respectively. Use 100 ohm across emitter-base of transistors.
It will divide the input voltage into two exactly equal voltages, I have published it, it may be possible to find the circuit diagram and scan it to a gif file

another method is applied in the TNC2 or MFJ1270B using NE556 as a dual phase alternator operating on 10. Fed with +12V it is possible to draw at least -9V@50mA, I have used this circuit in some occasions, I have drawn a circuit diagram in powerpoint and converted to gif file. It uses 4x 1N4448 diodes, will even work for 1N4004 diodes - even on 20kHz(!) - with high efficiency (pse don't ask me why!)

Recently, I saw a thread here involving the repair of Atwater Kent transformers. One gentleman described the core as being composed of individual (iron?) wires. Does anyone have a bitmap or a link to an image of the internals of such a transformer? I'd like to see how these were constructed.

Remove NOSPAM from my address to email me. Thanks in advance.

Pete

From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01be6f8e$fcf1d960$14e4abc3@default>
Source record: 72364

Hello folks,

The virtues of large diameter antenna conductors and of 'folded' dipoles are often extolled. But how virtuous ARE these fat, doubled-up radiators ? From where can a quantitative description be obtained ? Why all the secrecy ? Do the Guru's really know how much broader will be the SWR bandwidth of a 40m dipole after increasing wire diameter from 18 gage to 14 gage. It certainly makes it a lot heavier. Or by replacing the antenna's single conductor with ubiqitious 300-ohm twin line, also used for the feeder. It catches the wind better.

Feedpoint impedance, in terms of R+jX, and SWR on the feeder, versus frequency over a band within +/-5 percent of the resonant frequency, of either a simple or folded half-wave dipole, can be investigated by downloading program SWR_FREQ.exe from my website.

Input data:- resonant frequency, conductor diameter, if folded enter conductor spacing, feedline impedance and acceptable VSWR over the band.

Output data is a table of Rin, Xin, Refl.Coeff., and VSWR versus frequency. Also computed:- accurate overall length of resonant dipole, Q and 3dB bandwidth of the antenna when connected to a matched receiver.

Principal assumption :- height of dipole is greater than 0.75 wavelengths. Accuracy falls off at low heights depending on type of ground. Predictions are reliable at dipole length/diameter ratios down to 10-to-1.

Download brand new SWR_FREQ.exe now.

2934. Re: Mixer as frequency doubler

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-16 00:00:00 UTC
From: stuartlandau@my-dejanews.com
Message-ID: <7ckr8l$c8o$1@nnrp1.dejanews.com>
Source record: 72369

Peter, A mixer makes an awful doubler. Double balance pretty much eliminates the even harmonics. The type that mini-circuits sells consists of a wideband rf transformer, two hot-carrier diodes and a high-pass filter. It takes about +13 dBm drive. They are easy to make also for very little money. An RF transformer such as found in a television balun unit,two inexpensive diodes,and an rf choke and capacitor does it. Stuart K6YAZ,

2935. QST on CD-ROM

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-16 00:00:00 UTC
From: "Matt J. McCullar" <mccullar@flash.net>
Message-ID: <36ECDAAF.38B6@flash.net>
Source record: 72370

I went ahead and bit the bullet, ordering a set of _QST_ on CD-ROM without being able to try out the product first. I thank everyone on this newsgroup for their opinions.

I could have ordered these discs from a place in Dallas, but I went through the ARRL for two reasons: they offered a coupon discount in the paper version of the magazine, and I also didn't have to pay state sales tax. The discs took about two weeks to get here after I mailed my check.

I now am the proud owner of the 1990-1994 set of _QST_ on CD-ROM. What do I think? I am quite satisfied. The index-database searching function really makes things simpler and now I can let a new ham take ownership of my paper-based copies of these issues. I've printed out a few pages from disc onto laser printer, and while the quality isn't pristine, it's good enough for what I need. Schematics are more than legible.

I do have a couple of sticking points. 1) The covers of each issue are not included for some reason. 2) All images are in black & white. I guess this was done to save storage space, and I can live with it. 3) A few errors crept into the manufacturing process. On only my fifth database search, the disc called up what it thought was page 64, but in fact page 62 was displayed, and vice-versa. It appears that whoever scanned all the pages simply got the two switched. As long as this doesn't appear to be a continuous problem, I can understand a small error creeping into such a huge library.

On the whole, I am very pleased with this and plan to purchase more sets of these CD-ROMs for other years. Figure this: each set covers five years (average), and each set costs about $40. That figures out to eight dollars for one year's worth of QST. The digital version takes up LESS space and you can find an article instantly thanks to the search function. For me, it's no contest. I am so glad that the ARRL has done this!

I asked the editors of _Popular Electronics_ and _Electronics Now_ if they plan on doing something similar, and they said they're working on it. (Which would really save my bacon, because I've got back issues for those going back several decades.) They plan on issuing the most recent five years' worth of _PE_ and _EN_, and work backwards from that. Hallelujah! :)

Some magazines are now defunct and if I want to see them on CD-ROM, I may have to do it myself. And I doubt I'll be able to include a database-search function on those, but what the heck.

No one is paying me to say this, I'm not getting my arm twisted, and there's nothing backhanded about my stating my opinion here. I'm simply a ham trying to spread the word about what I think is a good product. If you want a good chunk of your shack back, try the CD-ROM-based version of _QST_ and you won't be disappointed.

Eric,

Sure - Wal-Mart, K-Mart, just about any well-stocked hardware or department store. Akro-Mills makes a bunch of that kind of stuff. Here at work we use a combination of containers and bins that have accumulated over the years, from $$$ 3M anti-static containers to $10 plastic boxes and drawer. Most components can go right into the clear polystyrene drawers, but we line the drawers with anti-static foam if we're going to store semicondictors in them.

Gee! And mine works so well too! I feed the RF and LO ports with the 5 MHz out
of a precision standard, collect the 10 MHz sum frequency out the IF port, and
feed that thru the old hound dog 10 MHz crystal that was my clock for my
counter using it as a one pole filter. Walla! A precision frequency counter
where before I was never sure about the last 2 or 3 decimal places.
You're not using the mixer as a doubler, you're using it as a mixer.

2941. wtd: Info on Neophyte receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-16 00:00:00 UTC
From: GREGORY HEATH <kb2qqm@email.msn.com>
Message-ID: <#vJdAB9b#GA.307@upnetnews03>
Source record: 72376

Anybody out here build one of the Neophyte Receivers for 40 or 80 meters
from "Dans Small Parts and Kits"? He offers a shortwave radio kit for $32.
What is the quality and how well does yours perform? thanks. Greg.

www.fix.net/dans.html

Have RF Cocepts 2/70 dual band amp. Output is 200 watts on 2 and 125
watts on 440. This is a FM amp only. In-put range is from 20 to 50
watts
to drive. The amp is in excellent condition. Has build in RF/SWR
indicators. Complete with power cables, manual and original box. This
is a very duty amp. Not for 100% duty cycle for repeater operation.
Works and looks GREAT!!!
Non Smoker.
Price: 360.00 Plus Shipping.

2955. Re: 10 meter rig or conversions

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-16 00:00:00 UTC
From: Peter Rachow <peter.rachow@metronet.de>
Message-ID: <7cmd32$m1g$1@news.dnsg.net>
Source record: 72390

Hello Michael,

I did convert some of these old CB-Rigs of the PRESIDENT brand some years ago from 11m to a very well operating 10m ham radios. These rigs were called President "Jackson", "Grant" and "JFK". I don't know wether they're still on the market. But you should be able to find them at flee markets for bargaining prices. They offer about 120 to 200 channels including ssb mode with RIT and XIT.

These radios are very easy to convert to 10 mtrs. because they use mixers to generate the operating frequency beyond the PLL stages. These wixers work with frequencies around 15 MHz and are fed by crystal controlled oscillators. By simply changing these crystals to some with a freqency about 1 MHz higher and a subsequent easy and simple readjustment procedure (tx and rx) you have got a fine radio for ssb operation around 28500 Mhz.

Modern CB rigs often have the shortcoming that they use PLL-circuits that can't be converted in their frequency range because they consist of PLL circuits that detect the generated frequency and refuse operation if you try to switch to an "illegal" channel. So it is recommendable to try to get a rig at least 10 years old not equipped with microprocessors or equivalent stuff.

Hope I could help you!

Third time's the charm!:

1. ARRL Radio Designer does circuit analysis, won't draw or read schematics. 2. TinyCAD: small, cheap, >good< CAD for drawing schematics, no analysis. 3. Tiny2ARD, W95 utility,translates TinyCAD netlists into Radio Designer netlists quick and slick, produces a complete RD circuit-description (BLK-END) block from a TinyCAD design, appends any number of blocks into a *.ckt file.

&10.00 buys Tiny2ARD, with ARD symbol library, and (full version.) shareware TinyCAD. [You still have to pay UKP 10.00 to TinyCAD's author, Matt Pyne.]

I'm a new Tech Plus and I've built a QRP transmitter. Seems to work too! At least no magic smoke came out. Unfortunately it came with a colorburst crystal on 3.579 Mhz. This is not within the Novice/Tech part of the band. Is there a band plan (formal or informal) for calling frequencies and QRP working frequencies? I've tried the Handbook and the ARRL web page but they just give the allocation, no information such as I've requested. I'm going to get some xtals cut for me and a friend to do a low speed CW net to build speed for our 1B test, but I need to know what freqs to get them on.

Craig

There has been a series of articles written by G3XJP and published in the Jan to Mar 1999 RSGB Radio Communications magazine for a 10.7-40.7MHz DSS system based on the Analogue Devices AD9850BRS. The article only describes the synthesiser element of a single conversion, general coverage HF receiver / transceiver. It maybe of some interest ??

Regards

Chris G4AGJ

Rich, you are obviously aware that rec.radio.swap exists for the purpose of selling radio equipment. You should also be aware that cross-posting to the other four groups is not appropriate.

For those not familiar with eBay, it encourages the leaving of feedback. Six people with whom Rich has participated in auctions have left negative feedback, cut and paste below. Rich bent the rules to argue his side a couple of times by improperly giving himself positive feedback. These are included.

Rich, anyone can have one or two disagreements customers, but your record demonstrates that you have a problem.

Cut and paste from eBay:

Hello All, I am looking for a very simple, 300 MHz "OOK" (on - off keyed) transmitter. I want to send telemetry using a AVR microcontroller in a battery powered application. Any ideas would be greatly appreciated. Thank you for your time..

It sounds like you're describing an increase in diameter as a way to reduce loss. This isn't usually a problem with a dipole, and isn't usually the reason a larger diameter is recommended. The advantage most see in it is increased bandwidth. To get the maximum bandwidth increase, it's the thickness toward the dipole ends (where increased capacitance has more effect) rather than the center that counts. Taking this to an extreme leads to designs like the "bow-tie" antenna.

You can easily see the effect of wire diameter on bandwidth (and loss) with any of the available modeling programs. The free ELNEC demo is adequate for analyzing a simple antenna like a dipole. It's available at http://www.teleport.com/~w7el.

In article <7cmbq9$n71$1@nnrp1.dejanews.com>, It was written:
>> Not really. Evidently you never heard of W4EBG back in the
>> 50's-60's

Wow! That call sign brings back a bunch of memories. I used to hear that guy on night after night in the mid sixties on or around 3850. He formed the nucleus of the same programming format which can be heard on 14.313 during the day and on several frequencies on 80 meters at night. In the sixties, the big racket was the sidebanders against the AM users. W4egb, who went by the name of Kahn or maybe Con which is what it sounded like lived in Paduka, KY and had a fabulous signal almost any night. He ran the full gallon and maybe a bit more for all I know on 80 and was, to say the least, a character. Just as is the case today, he and a large group of folks would feed on each other's pathology and scream insults, jam, and curse one another as long as propagation and the blood ethyl alcohol contents allowed them to transmit. Maybe somebody is familiar with the details, but I just remember hearing W4EBG and hearing about him around 1965 when I got a short wave receiver and began listening to ham radio. Just as now, the comments were pretty much the same such as, "Can't somebody do something?" "Man! such language!", etc.

I can't remember a time when there hasn't been a bunch of hot-heads hanging out on one or two frequencies on 80 after dark and making lots of noise.

I'm not even sure there is more of it today, but it seems to go on longer but I wouldn't swear to even that.

It takes at least two to tango and none of these famous or rather infamous souls would have gotten the notoriety they have gotten without others to fan the flames. Last weekend, I was listening to an almost sensible QSO on 14.313 when somebody started up the anonymous cat calling and whispering of obscenities. The two people who were having the QSO said not one single word about the racket and the whisperer finally got tired and went back to telemarketting or whatever it is he does when not on the air. I think that's the secret to stopping a lot of that stuff. Silence is a show-stopper for the weirdos because they can't gauge their audience and are not even sure they have one. Nobody likes to play to an empty house.

Reg,

You're technically correct of course, but someone just getting started with antenna experimentation is more likely to cut the antenna element a little long and trim to resonance, rather than mastering the theory behind adjusting a radiator length for the effects of dielectric and conductor size. After all, the final length of the antenna might also be affected by environmental considerations (coupling with other nearby metal objects, etc.) and trimming/tuning is the only way to determine that final length.

Source record: 72405

The resonant height of a 1/4-wave vertical antenna.

First calculate K = 0.225 / (Ln (Lambda / diameter)
- 1)

then Height = 0.25 * Lambda * (1 - K) metres.

where Lambda is free space wavelength in metres, diameter
is antenna conductor diameter in metres.

I metre = 39.37 inches = 3.28 feet.

But if your pocket calculator does not have Logs to the
base e, then download program SWR_FREQ from my website.
Takes only a few seconds.

The height of the vertical is exactly half of the computed
length of the dipole.

Geesh guys, I hope this doesn't sound too demeaning to us hams as technocrats but here is my answer;
The cost of a used HT amp right here on the newsgroups is around $50. By the time you purchased a 10dB transistor, new mounting hardware and insulator, heat sink, resistors, fixed and compression trimmers, a bit of coil winding wire, relays, a couple diodes, switching transistor, and a relay, you would exceed this amount, 'unless you had an excellently stocked junque box. . . if that is the case do a search on MRF transistor amplifiers and in about an hour you will have a schematic and PC etching template. Motorola has application notes for power transistors. You could also check the ARRL manuals at the library.
73 and email me direct if you do take this on and get in a bind,
Art k9xf

Hello Dan
Read your post and and some of the answers. As you are discovering, most of the ham population is old, but we are not all crotchety. Congratulations on getting your general at 14 years old. I was still swl'ing at 14. If you give us some idea of what you are wanting to do, I am sure you will get a few more specific answers. You probably can pick up something at swapmeet at a better price then buying new parts. That is one of the disadvantages of being a new ham--you do not have a garage full of "junk" that you have accumulated over the years that can be used for projects. Why not sidle up to one of the old timers with a known junkbox in the Tristate club and tell him what you would like to build. Ask him for some ideas--if you are lucky you might just strike a goldmine in parts and advice at the same time. Cross posting to so many groups is usually not productive.

Source record: 72410

These comments also made me curious. I went through a
simple back-of-the-envelope calculation and found some
very different results.

Perhaps someone can help me see what I'm missing here?

For purposes of the analysis, I made the questionable
assumption that we have a plane wave.

A 30 uV/m field strength corresponds to a power density
of approximately 2.4 picowatts/m^2. Assume for the moment
that the source is radiating equally in all directions.
(This is because I'm lazy and it's simple to compute the
surface area of a sphere with a 30 m radius.) Hence, I
compute a source power of:

(2.4 picowatts/m^2)*(4*pi*(30 m)^2) = 27 nW.

In other words, my hypothetical isotropic radiator will reach
the 30 uV/m field strength limit with a power of only
27 nanowatts. This is approximately 83 dB below 5 Watts.
As Roy pointed out, we also need to include the gain of a
real antenna as well as ground reflection effects. Thus, my
simple analysis predicts that we would need to be somewhere
in excess of 90 dB below 5 Watts to meet the requirements for
an unlicensed intentional radiator in the HF bands.

So why did my analysis deviate so far from Roy's?

The plane wave approximation is suspicious, but 40 dB seems
like a pretty large discrepancy. Basic arithmetic sometimes
causes me problems, so the answer may be obvious to everyone
else...

Now, now, cost-effectiveness isn't the only reason to homebrew, is it?
Without wanting to start a thread on the philosophies of homebrewing,
it must nevertheless be stated that the desire to build need not come
solely from a desire for economy. Such a view, stated alone, reflects
an egocentrism on the part of the speaker/writer.

> if that is the case do a search on MRF transistor amplifiers and in about an

Now, here is the egocentrism-destroying part! Well written, Art.
Don't forget that the 1998 version of the ARRL handbook has an article
in it on a 2m amp using one of those RF power modules.

There's also a guy on qsl.net who parallelled 4 (count 'em, 4) 70cm
power modules to make a 100-watt power amp. Go to www.qsl.net and
perform a search for "amplifier" to find it... Interesting stuff!

I'd like to "convert" a simple and inexpensive AM/FM radio into a shortwave receiver. I understand a mixer and local oscillator circuit(s) should accomplish this end.

Though I have found a few general circuit schematics - I am finding a lack of information on procedures for actual component selection and calculation, JFET biasing, etc...

Any suggestions on what steps to take next would be greatly appreciated. Thanks in advance for your help.

Best wishes,

Brett

I don't know whether this is the same thing being described, but the
ARRL's "FM and Repeaters" handbook from 1972 has something like that. The
section on discriminators came from a 3 or 4 part series on FM reception
in QST at the beginning of 1971.

It doesn't call it anything other than a "bridge discriminator" and there
is no reference for the original circuit.

The incoming signal is split with a pair of resistors, and each feeds a
1/8 wavelenght piece of coax. One piece has the far end open, and the
other has the center conductor grounded. It makes up a wheatstone bridge.
The voltage at the junction of the resistors and coax varies with
frequency, "in such a way that the difference between the two is a
straight-line function". Those points are detected by voltage-doubling

Am detectors, and then combined.

It mentions that because of the physical length of coax that was needed its operation is limited to the mid and upper VHF region.

The problem is that the higher in frequency it operates, just like any discriminator, the wider it becomes. The deviation becomes less and less a percentage of the center frequency as the center goes up, and thus the recovered audio becomes less and less. I would think this coax discriminator is really intended for wideband deviation.

Another approach would be to salvage the PA stage from a
defunct VHF commercial radio (unless that's why the radio
was scrapped...) and rig up some switching. One particularly
slick no-moving-parts approach I've seen involves quarter-
wave transmission lines (practical at 2m) and diodes.

RF Micro Devices sells some neat-looking RF Modem chips. I'll be darned if I know where you can buy them, but you could ask. (http://www.rfmd.com/)

Digi-Key sells some complete modules as well, but they're somewhat pricey. $30 range, as I recall.

I've been looking into a similar application - a wireless remote weather station. Not long rang - 20 yards or so. There is some neat information on the Web for using BPSK on LF (160-190 kHz band), which intrigues me. If I can find a hardware-only demodulator for BPSK, I'll build it. (Most hobbyists / hams seem to be using PC-based DSP software to receive BPSK, but I don't want to tie up a $200 PC as a remote display for the weather station.)

Good luck in your search!

Dave

2984. Multiple Posts

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-18 00:00:00 UTC
From: Brett Hall <bhall@emerald.tufts.edu>
Message-ID: <7crs44$5q5$1@news3.tufts.edu>
Source record: 72236

My apologies to the newsgroup for the multiple posts regarding "Shortwave Receiver Project". With each attempt I made at posting my message last night, MS Outlook had declared "server error - message couldn't be sent" - I gave up in the end in frustration.

Imagine my surprise today then to have four posts listed that supposedly hadn't been sent at all! The annoyance for you was unintentional.

Thanks again for the help.

Brett

I have 6 pcs 250TH Lewis and Kaufman for sale. They are probably made
on license from Eimac. These are brand new, in original super heavy
duty military boxes. Never been used. A very nice valve, indeed.
E-mail me if you are interested.

Best regards,

Arnold Goksoyr

I was going to recommend Kanga also, but their web site (in the U.K.) seems to be down. I suggest emailing Bill Kelsey. He's the U.S. Kanga dealer. His email address is kanga@bright.net.

Bill and I share a booth at Dayton. (I sell antenna modeling software.) We'll be there again at booth 504. Drop by if you're coming.

Source record: 72240

I was givin an old 2meter radio that works great on simplex with 500mw out. The flex antenna is attached at only one piont to the circuit board. I was wanting to attach a bnc connector so I can hook it up to an ext anntenna. I am guessing that the piont where it attaches is the positive or center feed of the coax but what is the neg or braid? My friend an I talk simplex all the time from our homes and I would like to make this rig dedicated to the freq we use. But the power is not enough unless I am on the roof so I would really like to be able to attach and external to it

Any help would be great.
Thanks

SS would do a fairly effective job of securing transmissions, I
would think. The problem is that there is very little (none?) SS
equipment generally available on the open market, so unless you wanted to
do it all yourself, it would be cumbersome. Also, if you don't get a
waiver, you have to use 23 cm or higher wavelength, and document each
transmission and save the records for a year.
A neat idea, but I think not quite ready for prime time.

From: tim <tvendt@kear.tds.net>
Message-ID: <01be7111$220099c0$1d9347cc@default>
Source record: 72418

I have an Icom 706 (original model) that has all of a sudden stopped transmitting on any
frequency that is in the FM mode. When I key the mike, the power out spikes up and
then drops to only a few watts out.... when I monitor the sig on a scanner, it sounds very off freq.... I suspect that the VCO is unlocked...
unfortunately I don't have a service manual for this and besides the unbelievable price, it will take 4-6 weeks to get! does anyone have the FM alignment procedures and test points, etc for this radio that I could get a copy of?? I'm not a "hack" at this stuff. I repair and restore vintage guitar amps for a living and I don't pay anywhere near what Icom wants for a manual when I need to get a manual from Fender or Marshall, etc etc. As a matter of fact, I can buy a notebook of schematics (75-100 of them) for the same price that Icom charges for just one radio.
Anyway... enough bitchin'.... any help would be appreciated. I would be glad to reimburse any costs incurred in getting copies, etc to me.
thanks..... Tim (Pro Sound
Technica)

I'd like to "convert" a simple and inexpensive AM/FM radio into a shortwave receiver. I understand a mixer and local oscillator circuit(s) should accomplish this end.

Though I have found a few general circuit schematics - I am finding a lack of information on procedures for actual component selection and calculation, JFET biasing, etc...

Any suggestions on what steps to take next would be greatly appreciated. Thanks in advance for your help.

Best wishes,

Brett

Thank you!! Our education system is not that bad, but I DO think that
intensive practice of a foreign language helps a lot.
As far as I am concerned, I use computers since I am 11, and I am now 22.
The use of computers implies a good level of vocabulary.
Later I discovered the Internet.
Of course it helps to browse many web pages in english.
Last but not least, the HF bands are a very powerful tool, I mean you can
listen to radios broadcasting, amateur QSOs!!
(I just realized it would be cool to learn Morse code...) :)

3007. Re: 1/4 antenna formual

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-18 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01be7189$ee973de0$LocalHost@default>
Source record: 72428

Dear Eric June,

The difference between resonant length (pure resistance input Z) and the theoretical length of 150/F metres for a half wave dipole, is so small we can usually forget all about it - because we are quite prepared to do some pruning. And because a teeny bit of twiddling with the ATU will correct it anyway. The height of the antenna above ground of the usual amateur's antenna, and the impedance and length of his feedline, has a much greater influence on what length of antenna wire he/she ends up with. How accurate is YOUR swr meter ?

So somebody just getting started with antenna experimentation can forget all about erecting an antenna 1 or 2 percent less than the free-space half-wavelength anyway. They are asking the wrong questions. Put up some wire of crudely the correct length and be prepared to do some pruning.

On the other hand, if they are asking for an arithmetical formula, they should be given the correct one and not something uncritically copied from some unreliable, error-ridden, amateur magazine/handbook's pages, full of misleading adverts, with magazine article editors just as ignorant as the authors.

Please don't confuse my directness with abuse of your contribution. Indeed, as I have done, enjoy some happy pruning !

Do a web search on a kit manufacturer called Kanga. They may something
you could use.

Mark

I was just reading about one in the '99 ARRL Handbook (p13-44). Uses a
toshiba S-AV7 or S-AV17 for 25 or 50W version respectively... wonder
where to find these, and how much? Alternatively, Radio Shack was
closing out their 2m amp for $30 a while back, if you can find one.

I think the point is to have FUN! we all know
we can go down to the drug store and pick up
a radio that will outperform anything we can
make or modify.

My forte is building tube and solid state radios,
winding my own if transformers, rf coils, osc coils etc...

In my opinion, the poster should start first with
an old am tube type radio... all american five line up, either octal or 9 pin
miniature just to get better angle at the parts. Select a bandspread and
knowing the circuit configuration, simply re-wind your rf and osc
coil(s). I have done this, in fact the old USN
TCS series receivers were nothing but AA5
type of circuits using octal 6sk7, 6sn7 etc..with
proper band and osc coils but keeping the
455 kHz IF. They arent the best performers,
but again, the point is to have fun and learn.

As far as taking a standard modern am/fm radio,
I think you would be hard pressed to get at most of the miniature components
easily, as well you are looking at converting osc and band coil(s) which are
small enough already
and re-winding them. you wont easily find any commercially wound rf and band
coils for that
particular radio. You can buy small coil parts
and kluge new coils etc.... using wire so fine you can hardly see it..... It
might be easier to
build a converter, these are sold as kits and
introduces another level of conversion..I saw one advertised to use with a
standard am car radio. I dont think you would need to do anything to any of
the BJT or JFET biasing,
you are really only changing the osc and rf
freqs at the front end and should leave the
IF strip alone if you do attempt to modify a
modern am/fm radio.

Anyway, thats my 2 cents.

Have fun.

Your fellow radioman and marconi-man
Tony

Yes, for awhile I had a Heath 1w in/10w out amp that used that
arrangement. Really pretty cute -- two quarter-wave lines, with a pair
of back-to-back diodes (in fact, I *think* they were plain ol' 1N4148s
but not certain) across the lines where they joined. One line on the
output connector, the other on the input.

No drive: the diodes don't conduct (at least as long as there's less
than 0.7V P-P of RF on the antenna!) and the lines essentially behave as
a piece of coax. Feed it some drive, and the diodes conduct -- putting
a short circuit at the junction point -- and reflecting a near-infinite
impedance at each terminal of the amp. Worked quite well. (especially
on a packet station in the room next to my bed!)

Reg,

I completely agree! I think the 234/f(MHz) equation is really meant to get you in the ballpark so that you know about how much metal to toss up in the air and start trimming. You would want to add at least 5-10% to that number, of course.

Gary,

I use a Wilderness Radio NC40A 40m CW QRP rig for backpacking and it is a very easy kit to build, well documented and easy to align. Exceptionally low current drain, good receiver, option for a built-in frequency counter and keyer (a great option, I have one in mine). Here is the URL:

http://www.fix.net/jparker/wild.html

If you want SSB and don't mind tackling a more advanced kit, try the Elecraft K2:

http://www.elecraft.com/

Here are some links I've collected to other QRP transceiver kits, I don't know much about these:

http://qrp.cc.nd.edu/QRP-L/catalog/qrpplus/qrpplus.html

Um - that's actually 0.7 volts at the diodes. The 1/4 wavelength of coax acts like an impedance matching transformer, converting a low voltage signal at the antenna terminal to a high(er) voltage signal at the diodes. The diodes clip this down to 0.7 volts, which then gets transformed back down to a tiny voltage at the amplifier input by the other 1/4 wave coax run. The impedance transformation is important - otherwise you could just hang the diodes on the amplifier output.

Even seen a glass light-emitting diode? One that projects "1N914" on the ceiling?

Dave

Hey, I've been listening to this thread for a while, and I'm not too
sure what is happening with the two pieces of coax... Are they for
switching the amp in and out of the circuit--in effect, acting like a
T/R switch? If so, where can I find some more info on this? It sounds
interesting. Thanks.

It's standard transmission line stuff, the way a 1/4 wave
line inverts impedances.

On receive the diodes act like an open circuit. On transmit
the diodes at the PA output conduct (short circuit), appearing
as an open at the other end of the line, disconnecting the
antenna (not to mention the PA output from both the PA input
and the HT input) from the HT. Similarly, the diodes at the
HT output conduct (short), appearing as an open at the other
end of the line, disconnecting the antenna from the HT and
sending its power to the amplifier instead. All the usual
references.

I've seen examples in the ham literature - in Ham Radio
many moons ago, and in VHF Communications/UKW-Berichte
quite recently.

Another clever application of transmission lines I saw recently
involved faking a variable inductor in a VXO by transmogifying
a variable capacitor with a lumped 1/4 wave line...

hinermad@my-dejanews.com wrote:
> Um - that's actually 0.7 volts at the diodes.

That too..

Is not the impedance of the diodes substantially higher than 50 ohms?
(I mean, when they aren't conducting)

In that case, the 1/4wave line hooked to the antenna connector is
connected to another 1/4wave line hooked to the transceiver connector,
which in turn goes to the input of the receiver, which is in theory a 50
ohm load. (admittedly in practice not true, but presumably close enough
to make things work) So we have 1/2wave of 50-ohm transmission line,
ending in the 50-ohm load of the receiver input - essentially the same
thing as if we'd added another 1/2wave of RG-58 between the antenna and
the receiver.

Now, when we key the transmitter, these diodes (which had been just a
minor impedance bump in the middle of a 1/2wave piece of transmission
line) become something pretty close to a short circuit. Now, the two
pieces of 1/4wave line do become transformers, transforming the very low
impedance of the conducting diodes to a rather high impedance across
both the input and output of the amplifier. So the two lines have
relatively little effect on the input and output matching, and at the
same time the near-short-circuit at the midpoint prevents output RF from
getting back into the input. (and turning the whole thing into an
oscillator)

Shame on you. There's a whole lot more to amateur radio than spending money. What Dan is wanting to do is both legal and beneficial. If he builds the amp and you buy one, he'll know a lot more about it. Find something constructive to say or move on.

3032. RX-320 - Free Software

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-19 00:00:00 UTC
From: mktg@ix.netcom.com
Message-ID: <3772ac3c.20582959@nntp.ix.netcom.com>
Source record: 72267

March 19, 1999

Dear RX-320 User,

Beta version C of the Flexi-Tuner software for operating
the Ten-Tec RX-320 is now available.

Many thanks to all the beta testers for their excellent
ideas. I have incorporated as many of them as possible
in this version.

The major features of the new beta version are as follows:

1. Operates the RX-320 from virtually any desktop
or laptop computer, including older 386 machines.
2. Works in either DOS or Windows (this is a DOS
program).
3. Implements 34 selectivity filters.
4. All modes: AM, USB, LSB, CW.
5. AGC implemented: Fast, Medium, Slow.
6. Tuning steps down go 1 Hz or up to 1 Mhz.
7. Adjustable squelch (operation improved).
8. Bandpass tuning (offset from center freq.)
9. Scanning using scan files. Adjustable parameters.
New! 10. Built-in scan file editor.
New! 11. S-meter.
12. Almost all parameters adjustable (great for
knob twiddlers like me).
New! 13. Improved interface (more logical).
New! 14. Tighter code for faster operation.
New! 15. Improved receiver initialization.
16. No mouse required (or supported).

I have been running the new beta version for the past
couple of weeks on an old Grid 1750 386 (25 Mhz) machine.
It is really great to put the computer on my lap or
coffee table while I sit in any easy chair and listen
to the RX-320. The program has also been tested on a
486 machine, a Pentium 166, as well as a 400 Mhz Pentium
II. It works equally well on all of them in either
DOS or windows.

I would be happy to supply free of charge this Beta version
to anyone interested who has an RX-320. The software will not
function without an RX-320.

The program is supplied along with several scan files in a single zip file. Installation and removal are simple, as the program does not affect any system settings either in DOS or windows (it does not mess with your registry, DLL's, or other system programs).

The program is easy to use - just press various keys to engage the different functions.

Installation, removal, and operating instructions are included.

If there is enough interest, the Beta version may advance into a final version. In any event, I am not aware of any major bugs in the program.

This has been a very fun project - sort of like homebrewing your own ham equipment used to be in the days of tubes and discrete components!

If you would like to receive the latest beta version, send me an e-mail at mktg@ix.netcom.com and I will send you the zip file by return e-mail.

Regards and 73,

David

At 1/4 electrical wavelength a transmission line will act like a short
circuit.
Thus it is called a shorting stub. This is the basis of waveguide.
Waveguide
is basically two 1/4 wave shorted stubs joined. The shorted end is the edge
of the wave guide. This makes it easy to guess the transmission frequency
of some equipment by the size of the wave guide.

Not knowing any details on the radio I can only speak in general terms.

A good guess would be the negative side of the battery connections. Is there an earphone jack? The outer connection of that would be another place.

What type of radio is it that does not have a removable antenna?

The TenTec company also sell QRP transcievers. I have a 40 meter one I use. There are some nice things and some minor aggrivations. Basically you need to borrow a digital frequency readout HF rig for alignment purposes.

Why not just build a converter from a shortwave band to the AM broadcast band?

Let's see...530 to 1600KHz on the BCB. Using a 10 MHz crystal would give you 10.53 to 11.6 MHz reception.

Better yet, use a VFO for the conversion oscillator and you can select whatever band you want. I used to have one of these for SW use with my Drake B line (receive only!) and it worked fine--just plug it into one of the spare band select crystal sockets.

It has been difficult to tell from the discussion, but it sounds like there
is a 1/4 wavelength stub in series with two diodes (that are in parallel but
reversed with each other) then another 1/4 wavelength stub. Is my
assumption correct? or is the amplifier also between that? Thanks, Michael

Fredrik ï¿½berg wrote:
>
> is someone doing ethernet (10mbit) on 10ghz ?

Well, I have managed to send half of a 10BaseT connection about 6'
across my workbench, using both 10 and 24 GHz Gunnplexers. :-) I still
need to build my second transceiver unit (pair of cascaded MAR-6s in the
IF amp, MC13155 discriminator, MC10116 line interface) to complete the
link. Too many other things have piled up awaiting my attention,
unfortunately....

It turns out that it is better to use the AUI port on a hub or NIC
instead of trying to interface with 10BaseT directly. Otherwise you
have to cancel the local echo that occurs with the traditional
dual-Gunnplexer arrangement.

Collision handling is another issue that needs to be figured out at some
point. At a minimum the two ends of the link need to be in separate
collision domains, unless you want to come up with a collision
signalling system on the microwave link. The original N6GN design did
not address this, but it's not likely to be important for a simple
point-to-point link that connects two PCs.

He is a self proclaimed beginner. This is a bit advanced for a beginner
don't you think. Vectronic kits would be a better start and a lot cheaper
too! I think a 30 -50 dollar project should give him most of the
soldering, tuning, trimming, cutting and hacking and finally
sledg-hammering skills he will need!

I have one of those. I accidentally powered it up wrong polarity, took out all the IC's and the final transistor. I'm not sure, butI think something else might be wrong, as when I key it at home, I seem to get some RFI (my 2m rig's squelch opens up, the FM broadcast radio gets noisy). My antenna is a 50' dipole in the attic (I'm on the second floor), with a tuner that I built from a kit from Dan's. Have you noticed similar problems?

Also, I have to admit, being a student in electrical engineering has some advantages. So far, I've been able to use some really nice equipment to tune up my Ten-Tec (o-scope, spectrum analyzer, RF generator...).

Over all, although I have barely used it, I like the radio. I plan on putting up a webpage on this radio, with some hints and kinks that I found. Next project--a cw filter for the audio output.

3049. Re: VFO recommendation?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-19 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <36F2E1A5.6A364F49@teleport.com>
Source record: 72284

I found the reason for the discrepancy. EZNEC uses scientific notation, and the power I had set to get 30 uW/m was 1.86E-8 W. I glanced at this and reported it as 186 W. It was, of course, not that but 18.6 nW, which is 84.3 dB below 5 watts. (Going 2 places the wrong way with the decimal point made a neat 10^4, or 40 dB, error.) Your back-of-the-envelope calculation is just fine. I ran the same analysis at 300 MHz instead of 7 (where a distance of 30 meters is well into the far field), and the result is only about 0.5 dB different. So the plane wave assumption was fine.

I could have checked my results several ways. One is to set the power at 5 watts and look at the reported field strength. It was 0.4914 V/m, which is sure enough 84.3 dB, not 44, below 30 uV/m. But the best would have been to do a reality check using just the method you did. I often rag about the tendency of younger engineers to blindly accept computed results without doing a ballpark check, and here I did it myself -- and very publicly. How embarrassing. But a good lesson and reminder. Time to polish up that glass belly-button (so I can see where I'm going when I have my head where the sun don't shine). My apology for the goof. And I'll put engineering notation on the list of future EZNEC features!

Thanks for spotting the error!

Ignore the spamming BS you may get here Dan,
Ofcourse you can HB an amp.. I have many of times. It's fun and a great learning experience.

It's a shame there are so many "appliance operators" hanging out on VHF but with today's ease on licence requirements I guess we get what we get if we're going to keep the hobby alive.

I have used many different sources from CCI to RF Parts Ramsey sells an OK kit at a decent price but the best performance I ever had was by using an old VFH Marine Tube rig. and converting the PA to 144 Mhz WORKED GREAT on SSB and FM.

Good luck and don't let the CB'rs get you down... <= That should stir up some interesting discussion!

3051. Re: What constitutes Homebrew?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-19 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <36F2E610.6D76CD59@teleport.com>
Source record: 72286

I've kicked this one around some in the QRP community, where all sorts of built-at-home rigs are common. My conclusion is there's no universally accepted definition. In fact, I don't think one is possible. The problem is that there's a continuum extending from rigs built from individual components to ones assembled Heathkit-style. Lots of people modify rigs. Modifications could be as simple as changing one component, to the point where you couldn't figure out what kind of rig the person started with. At what point in this modification process, if any, does a rig qualify as "homebrew"?

Even with a "scratch-built" rig, the level of integration could be used as an argument about what makes homebrew. What if the rig is just a module or two wired together -- is that as "homebrew" as one made from 2N2222's? How about the folks who make their own boxes, dials, knobs -- or capacitors? Are they the only true homebrew rigs? Do you have to design the circuitry for it to be homebrew? If not, is it more or less homebrew if you buy a PC board for it, or copy a PC board layout from a magazine?

My personal definitions are that an unmodified rig assembled from a kit isn't homebrew. One you design and build from individual parts is. The line in between is very, very fuzzy. But -- again my opinion only -- any activity that exercises the gray matter is good, and whoever does it can be proud of the accomplishment. Fiddle with your rig, and when you feel its characteristics are more your doing than someone else's, call it "homebrew" with pride.

It is an old Icom no model number on it or even inside the case.
The antenna is a soild piece connected buy a small screw or bolt. Only one
connection. It does not have a spkr or mic input/output, but i was hopeing
i could just solder a couple connectors to the wires the run to the spkr and
mic. If that helps?

Thanks for your time.
Ryan

Michael

Sure wish I was better at ASCII art<G>.. The following will probably only
make sense in a fixed-width font small enough to provide at least 80
characters to a line:

```
input connector ==============amplifier
electronics======================output connector
|
|
| 1/4wave line
1/4wave line |
====================|==============================
|
diodes (2, one
with cathode grounded & other with anode ground)
|
ground
```

I'll try to draw something more sensible in Windows Paint & post it to:
personal.bna.bellsouth.net/~w9wi/trswitch.htm

That'll take a few minutes, don't expect to see it any earlier than 2200 CST
Friday 19 March.

I suspect, despite all the sarcasm, that the original poster intends to use
the HT as either a mobile, or base. I too would be interested in home-brew
2m+ amps, but I personally would prefer to hook them to a mobile/base

I've built, tested, and operated the K2. A great QRP rig! The QSK is the best I have heard. The manual is superb! The few problems found by the field testers will be corrected in the production units which you order now. I'm waiting for the SSB and antenna tuner modules. Check out http:\\www.elecraft.com for comments from other field test builders.

3058. Can this be done??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-19 00:00:00 UTC
From: Cyberhax <cyberhax@thegrid.net>
Message-ID: <6UGI2.3055$PM2.26183@alfalfa.thegrid.net>
Source record: 72293

I'm trying to develop a means of detecting (and measuring field strength) of microwave signals around 24 Gigahertz. I wonder if anyone has some thoughts on the matter?

My objective is to use an receiver tuned to an intermediate frequency (sub-harmonic?) so that I can use a commonly available radio and an omni (yep, omni) antenna. I want to be able to observe a field strength meter to determine the presence or absence (and everything inbetween) of a 24Ghz sig that spans over a short path (<100 meters) that has a beam width of =<10 meters. Using a receiver that is capable of receiving freqs less than 1.2 gigs is prefered.

Is it plausible that I could detect the IF of the signal ? The 24 Ghz signal is AM modulated.

Any thoughts greatly appreciated.

From: Rocci <rocci@worldnet.att.net>
Message-ID: <36F3E0CB.C2DEF506@worldnet.att.net>
Source record: 72179

Another way that doesn't require magnetic coupling is to make your signal generator have a 'stiff' known output impedance by, say, putting a 10dB 50 ohm attenuator at the output. Then select a good quality capacitor that resonates the inductor at the frequency of interest. Put the scope or other 'non-loading' measurement device at the output of the attenuator, and hook up the LC circuit in a series configuration across the output.
Tune the generator until a resonant null is observed. The equivelent resistance (R) of the inductor can be calculated from the depth of the null. Q of the inductor then equals inductive reactance divided by equivelent resistance.
This only works if the capacitor Q is high compared to the inductor Q (which is usually true), and if the scope is usable at the frequency of interest.
At higher frequencies, a logarithmic signal level meter, a spectrum analyzer, or possibly a calibrated 'S' meter can be used.

My apology. I gave the wrong Dayton booth number for Kanga U.S. They'll be with me at booth 514, not 504. (504 is my G-QRP Club membership number, and I get it confused with the booth number.) The G-QRP Club also sells lots of inexpensive, simple kits through Kanga U.K., and they also have a booth at Dayton. They'll probably be at their usual location of booth 242. Several other QRP kit vendors are always at Dayton, so it's a great place to check out the merchandise and ask questions. There are also show-and-tell and other QRP activities at the Days Inn South all day Thursday, and on Friday and Saturday evenings, sponsored primarily by the QRP-ARCI. NorCal (Northern California QRP Club) as well as many other regional QRP Clubs are well-represented there, so Dayton is also a good place to make contact with a club.

Anyone interested in homebrewing should look into joining NorCal and/or the G-QRP club. Their excellent magazines, QRPp and Sprat respectively, are always chock full of projects, from simple modifications to popular QRP kit rigs, to full transceivers.

But the original post was cross-posted to pretty much all the newsgroups
in the rec.radio.amateur.* hierarchy which surely would explain the early
answers. Someone's comment about building an antenna (that's homebrew)
is a little more understandable if you consider that the post landed in
that newsgroup. And the "buy one it's cheaper" undoubtedly came from
someone reading the post in rec.radio.amateur.misc (or
rec.radio.amateur.equipmenter where I think it landed too).

It may not say much about the state of amateur radio, but hopefully it
explains the early comments in a newsgroup that is meant to be about
building.

Like Roy says, it depends... But if you plan on working one of the
qrp or homebrew contests, check the rules. Most of them are pretty
lenient on the topic of what is or isn't homebrew.

Butch,

Not sure what you mean.&#65533; I think the NC40A is very appropriate for a beginner.&#65533; A single circuit board, good documentation, and I put it together in two evenings.&#65533; My only equipment was an old/corroded Rat Shack soldering iron, needle nose pliers, dikes, a normal pair of pliers, and a $10 Rat Shack VOM.&#65533; Didn't even have a second radio or a frequency counter, I just used the built-in KC-1 counter to align the VFO and tuned for max power using the sidetone amplitude, which is directly derived from the RF output.

Lauren,

See if you can find a basic book on Op-Amp design. If you have Radio Shack stores in your country, I think they even sell a small booklet on the subject which will do just fine. Summing signals is easy to do with a single op-amp, and such a circuit will be listed early on in the book. I refer you to a book because I don't think I could draw you the circuit with just the ASCII characters.

David,

There is no consistent definition. My personal definition is that kits don't count, nor do things that you construct directly from articles in QST, 73, ARRL Handbook, or the like. In my personal definition, you have to *design* from scratch at least one significant module in your project. Preferably, you design them all. Then you have a true homebrew rig. I'm an electronic engineer by training, so I have a certain bias here. :-)

I certainly don't disdain the use of kits. They are a good way to gain experience in the area, and it will usually be more economical to build a kit vs. a true homebrew. When you go from an original design to a completed project, you go through a lot of parts experimenting and tweaking your design. Unless you have a great junkbox, that will cost you more than the complete set of parts that you get in a kit. The kit might even outperform your own design! My NC40A QRP kit transceiver runs circles around the true homebrew QRP rig I designed/built while in engineering school.

Note that most of the QRP contests that have a "homebrew" class define homebrew to include kits.

>If this doesn't change his mind about a "home conversion" 'nuttin will :)
>

Im not trying to discourage him, just suggesting a starting point. It might
build
the confidence needed to actually then go
in and perform surgery on a modern solid
state radio.

Most of your average hams dont have the
skill or knowledge to do the conversion of
an AA5 which means using some basic RF math too. If you can figure that out,
you
shouldnt have any problems doing it to a
kmart am/fm assuming you have the manual
dexterity to pull coils/rebuild them in such
cramped quarters but then thats what separates those of us who can call
ourselves
radiomen and those who never open and attempt modifications, fixes etc. Never
learn
cw, operate uhf/vhf exclusively and give others here a generally bad time. Oh,
but
they are 'hams'. I proud of the guy for even
comtemplating something like that, more hams
should learn how their radios work and maybe even MAKE one... a direct
conversion, simple superhet, rock bender..
qrp xmtr... all he gets from you guys is 'give up' 'suicide, jimmy'. I meet
so many younger
hams that just dont have a clue and I dont understand how just talking on
vhf/uhf or packet and never actually figuring out or even wondering and
pondering about the
eloquent mathmatics behind it all can give them any pleasure. But then, I
never understood the attraction to CB radio either.

Yep, to me... fun is listening/talking to a far distant HF station on radios
you built/designed
yourself (and maybe even the dipole or yagi)
on a cold star-filled winter's night.

The wonders of the universe around us.
It's interesting, isn't it?

"what good is it?"
.....it's coming from out there...
"out where?"
.....space....

"just space? You've spent thousands of dollars on
transistors..and..and..circuits
and cathode ray...what good is it?"
.....well.....it's interesting.....

Very well put.

I've operated with a store-bought rig; with an unmodified Heathkit; with someone else's design built to spec; and with a rig totally designed & built by me.

Each offered its own results & thrills. I would call both of the latter two "homebrew", but the thrill levels were very different!

One way of summing N signals is to use N transformers,
primaries across the individual signal sources and
secondaries all connected in series with each other.

If you don't mind more loss, just connect one end of a
resistor in series with each source and connect together
all the other ends of the resistors. Followed by an
amplifier with negative feedback to the common point.

The ancient land of Sumer was the very first on this Earth
of ours to become civilised. Its people, the first
engineers, invented the wheel. The modern name of that
land is Iraq. Cruise missiles and stealth bombers have
recently returned its inhabitants to the stone age.

Hi Gary,

I am also new in homebrewing. I bought the Sudden RX from Kanga. It
works fine, and now i try to modify it :) (hopefully it works ...)

(My first electronic project ever...)

Also it is worth to visit the page http://hem2.passagen.se/sm0vpo
(on this page there is an 80 meter frame antenna from SM0VP0, I try to
build and use it for the Sudden RX).

If you find also usefull information on the Internet for homebrew
beginners, please send a short reply to me.

Chris

>I'm trying to measure the Q of a ferrite core inductor
>and an equivalent value air-core inductor. I know the
>Q of the ferrite may be less but so is the size!
>

I'm assuming you are talking about an inductor wound on a slug, not a pot core or toroid. If so, you can think of the inductor as a loopstick antenna.

A reasonably quick way requires, as noted in the other replies, a signal generator and a scope. The trick is to not load down the coil with either the signal generator or the scope. What I do is take the signal generator, and drive it into a loop of a couple of turns of hookup wire, maybe 2 " in diameter, to make a 'transmitter', I put that a distance away (inches to yards, depending on the geometry and inductance -- it doesn't matter very much) from the ferrite inductor, with the axes arranged parallel, so that the loop will transmit to the inductor. With an oscilloscope and a high-z 10:1 probe, add capacitance across the inductor until the inductor-capacitor resonate at the desired frequency. Then, just vary the signal generator frequency to either side of resonance to find the points that the output signal drops 3db from the peak. The center frequency divided by the difference in the -3db points is the Q.

After doing that, you really need to check that the scope probe did not load down the coil. To do that, you should have an idea of the inductance. If you don't know it already, you can find it (approximately) by adding another capacitor across the resonating capacitor and then finding the new resonant frequency. Armed with the values of the resonating capacitor and the additional capacitor, and the two frequencies, you should be able to solve for both the inductor's inductance and its distributed capacitance.

From the inductance, calculate the reactance at the resonant frequency, and then multiply by the Q you measured. That result should be much much less than the scope probe impedance (like a factor or five-ten or more). If it is not, then you will need to go to the trouble of making a little jfet or mosfet preamp to use in place of the scope probe.

Depending on the ferrite and frequency, don't count on the ferrite Q being lower. Q's of more than 200 for low frequency ferrite loop antennas are not uncommon, and these are, after all, just ferrite slug inductors.

If you are in fact using a magnetically closed structure, like a pot core or a toroid, you can do the above, but you will need to couple the signal generator to the inductor in a way which does not load the inductor. For a toroid, its pretty easy -- put one turn through the toroid and then use a very high value resistor in series, to the signal generator. This won't work for the pot core, so you have to connect directly to the coil winding, with a resistor much larger than the reactance times the Q you are looking for.

Source record: 72325

Yes Jim, it is a very simple and accurate method.

If you havn't a digital signal generator then use your transmitter on low power connected to its antenna. The coil under test with its tuning capacitor on the bench will pick up sufficient signal. If the coil core is a closed ferrite ring it may need a foot or so of wire to act as an antenna.

To make sure the scope or other RF voltmeter does not load the coil, use a 1 or 2-turn link coupling to the scope.

When varying transmitter frequency looking for the +/- 70.7 percent voltage points, don't move anything except the Tx tuning knob and your eyeballs.

454 and 468 kHz were ship working frequencies for some 75
years. One would think that 454 would especially be troublesome
for a 455 IF. The MF maritime band ran from 405 to 535 kHz.

3113. Re: Shortwave Receiver Project

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-21 00:00:00 UTC
From: John Kiljan <jpkiljan@ix.netcom.com>
Message-ID: <36F4B243.A31AD56E@ix.netcom.com>
Source record: 72198

Brett,

Years ago I converted an old transistor pocket AM/FM radio to shortwave and it didn't cost anything more than a bit of time and solder. No new parts were needed although I wish I had taken the time to put together a band spread capacitor since the backlash in the main dial got pretty aggravating as I moved up in frequency.

The reason it was so easy is because on a typical cheap transistor AM radio, the local oscillator is actually resonated by the ferrite antenna. All I had to do was start unwinding loops off the the main ferrite slowly till I got it to the frequency range I wanted. If you go too far, just wind some more back on from the pile you are going to have all over your workbench. You will be lost, so it would be nice to have something oscillating at the frequencies that you are looking to hit as a reference to work toward. I was able to get a settiing that brought in both the 6 and 9 MHz broadcast bands. (Or, was I just getting the 6 MHz band and its images 910 KHz away? So long ago, I don't remember now.) Anyway, when you think you have it about right, just cut off the excess wire and solder the ends of that tiny wire together.

The ferrite antenna will pick up signals of its own, but they will be weak. You can short over the base of the telescoping FM antenna to a simple two-turn coil that heads to ground with the two turns wrapped over the far end of the modified ferrite antenna. That way you can use the FM antenna as the SW antenna and it also gives you a place to clip on another 10 feet or so of hookup wire that has an aligator clip soldered to it. To complete the job, I cut and marked up an index card with the new stations I was hearing (BBC, Deutsche Welle, Havanna, WWV, R Nederland, etc.) and pasted it over the old dial marker.

Was it any better than a cheap AM/FM/SW radio that I could have found for $5 in any flea market? Absolutely not! But it was fun and I felt proud of myself listening to that thing late at night in bed as I drifted of to sleep. To do a more serious job, in addition to the bandspread I already mentioned, a 455 KHz loose-coupled local oscillator for sideband and code reception, a voltage-regulated power supply to the local oscillator, an S-meter readout, and finally . . . wait for it . . . a digital readout would all be pretty straightforward if you spread the whole thing out on a breadboard and sank a few more weekends (and a lot more $'s) into it. But then, that probably wouldn't be as much fun. And, that's what we're trying to do here isn't it?

Good luck,

-- John (N0BUP)

I doubt this very much.

If the ferrite rod winding controls the frequency, then it isn't a superhet, but some kind of TRF.

If it has an oscillator at all, then it will have a separate oscillator coil..

Hi,

inductors with an inductance of some 100 nH and a self resonating frequency well above 1 GHz seem to be a problem. Can small ferrite beads be used instead of coils for biasing the MiniCircuits or HP MMICs and similar circuits? If so, what type of ferrite material (preferably AMIDON types) is the right one for frequencies up to 1 GHz?

Hi,

for my homebrew 10 MHz - 1.2 GHz RF signal generator project I need a switched 0-20-40 dB attenuator. I thought of using two shielded 20 dB SMD resistor attenuators and micro-strip RF relays (OMRON 6GY) for switching this stages in and out.

What is the best circuit topology for the resistors? Pi or T-network? Will two cascaded Pi or T networks _for each 20 dB attenuator stage_ give better results? What is the
formula to calculate the values of the resistors of the "double Pi" or "double T" network?

There is nothing better than do your own radio, turn it on and begin to
listen the bands and discover stations from far away.
I suggest you begin with a simple one, a regenerative, for instance.
There is a kind of magician in listening the shortwave band with a receiver
constructed with a single tube, a phone and half a dozen resistors, capacitors
and coil.

The really beautyful resides in learn, do and see your radio beginnig to
work. And this you can't get "buying" a radio. Do it yourself, wind your
own coils. Begin with simple things. Go step by step increasing
the complexity of your radios, there is no end for it.

You will have time to grow up and compare the more elaborated circuits with
the simplers. The beauty of simple things must be known by the begginer
to take advantage of it or, even to not reinvent the wheel.
Go ahead, modify the coils of an existing receiver make it operate in the
band you want.
Do a converter, use an existing receiver as your first IF, enjoy it.

In the 70s(I was 19) I did a receiver for the 11m band(CB) using an old
receiver with a 455KHz FI, detector and audio without modification. The part
I introduced was a RF amplifier an oscilator and a converter. It gave me
years of pleasure and hundreds of contacts with USA, Canada, Europe, Africa,
Central and South America. Simple and very cheap (all the components came
from old TV selectors and old radios) .

Do it by yourself !

Kinda.

The technology exists. Big problem is, the current state of the art for radio modems is pretty slow - maybe about the same as an old 1200bd. modem. Speeds up to about 4800bd. are possible if you're technically qualified to hack some radio gear. You *can* surf the Web that way, but it'll give a whole new meaning to "World Wide Wait"!

There is research in progress (in fact, a project in development) for an Ethernet-speed system. --

do a websearch on WAN, wide area network.
there are plenty of devices to do just that.
some are reliable, so they say, at 256kbps.
not as good as 10 or 100baseT of course,
but still better than a 56k modem.

I tried the Dynaart system, and didn't like it. I'm going to the
DuPont Riston PCB film. The toner transfer paper shrinks pretty badly
when you run it through the fuser. This causes traces to be stretched,
and smeared. Very bad for fine line work, and, the stretching can/will
sometimes prevent the toner from properly bonding to the copper. This
might not be spotted before you etch the bd, and the toner will flake
away while etching. THis leaves breaks in the traces.

I just gave up on it in disgust. I hope you have beter luck than me.

Has the search engine been improved on later releases? I
got the 1985-1989 and the 1990-1994 CD sets when they first
came out. If I read the instructions often enough, it does
wouk, but the search engine has to be the MOST user HOSTILE
software I have ever seen! Without doubt it is on the
opposite end of the spectrum from intuitive! It is even
worse than the low production volume, specialty (translate
low-level & buggy) software I use on an antique DEC RT-11
driven piece of x-ray analysis gear at work.... BTW, I know
they are B/W TIFF images and cannot be searched like text
documents, but at least ARRL could have entered the all the
table of contents of all issues in a text format file and
enabled a *reasonable* a word match search.

Newbie needs help brewing an S-Meter for fox hunting.

Hello all,

Fairly new to the world of amateur radio, and have been bitten by the fox-hunting bug. Would like to add an S-Meter to my quad antenna rig in the truck, and would like another one to take in the field with my handheld yagi antenna. Any help would greatly be appreciated as far as resources and references.

Source record: 72221
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I purchased a partial kit (PC board, crystals, and ICs) and built the kit about a year and a half ago. The rig has adequate sensitivity, clear audio on transmit and receive, and the receive current drain is only about 35 mA. After checking out the transceiver, I made the following modifications:

1. The author of the plans seemed to have a misunderstanding of how you measure PEP. He talked about measuring peak-to-peak voltage across a 50 ohm resistor, squaring it, and dividing by 50 to get PEP. He left out a factor of 8. At the time I bought the kit, it was advertised as having 5 to 8 watts output, but mine would only put out about 5/8 to 1 watt PEP. I used a voltage doubling transformer between the output transistor and the filter to bring the PEP up to about 3 watts with a 13-volt supply.

2. The VFO uses a type 2 (red) toroid core for the inductor. Substituting a type 6 (yellow) core (and adding a couple of turns to get the same inductance) improves the temperature stability by a factor of about 3.

3. The VFO inductor is very close to the T-R switching relay and experiences a slight inductance change due to the stray magnetic field. To minimize the amount of frequency shift between transmit and receive, it was necessary to rotate the inductor until the best position was found.

Possibly some of these design flaws have been corrected since I built my kit.

Hue,

Some filters are assymetrical with a steeper cutoff on the side closest the carrier. This is to provide additional carrier suppression. Such filters were generally sold in pairs.

Using a symmetrical filter (like many of the Collins radios) with a switched IF frequency works well, but you lose dial calibration of the main dial. Some radios used two dial pointers, one for each sideband. Collins handled this by shifting the PTO or another injection oscillator at the same time.

A possibility is an oscillating TV preamp/line amp (or
something else "taking-off" that is not supposed to). If
you don't have one, it could be a neighbor (unless closest
is miles away). Wouldn't hurt to try killing power to
everything in the house but the tv to see if anything weird
is happening with other appliances.

Do I gather from this statement that the interference is pretty much
continuous?

Note that hams and CBers are two-way operators -- they stop transmitting
about half the time to listen to the other guy. So if the interference
continues for more than about 2 minutes at a time, it's probably
something else. (and not police, fire, or commercial radio dispatch
either, for the same reason)

Interesting that it briefly clears (sometimes) when a fan powers on. It
makes me think you might have some computerized device in your house
that's generating the interference. Maybe the brief drop in AC line
voltage when the high-current load kicks in is causing something to
reset, and while resetting it isn't generating any interference?

(I would look at things like microwave ovens, timer-controlled
thermostats, external modems, etc.)

Good point. I've seen one of these take out channel 3 reception over
about a 3-mile radius, in a location about 50 miles from the channel 3
transmitter.

> tapping, etc. Nasty, and not bound to be too pretty when
> done.

A couple of ideas...

1) Flywheels from scrapped tape decks. They're already balanced. Paint them, pot them with tool-handle dip, or glue a plastic cap over them. They're already balanced. There's nothing more annoying than a radio that drifts because the knob is off balance!

2) A large plastic cap, Petri dish, or other suitably shaped container filled with glue & lead shot. This would be harder to get balanced properly, and a bushing to get it to stay on the control shaft may be tricky.

3) Why steel rod? Aluminum (if it's big enough - 3" sounds big enough) should be plenty heavy. If you make your knob -too- heavy it may cause the shaft to bind.

You've already expressed a concern about appearance, but in cases where the "home-made" look isn't a problem, think about sticking a metal rod into the side of a small knob, sort of like a long pointer. It extends the "virtual" diameter of the knob and makes it easier to make fine adjustments. May be tricky to do with a multi-turn control, because you need room to swing the rod. And it looks like a hack. (Well, it -is- a hack. But it works.)

Dave

To add to his question (since it is in a similar thread), what are the S
units a measure of (I think one S unit is something like 6 dB, but is
that recieved power?)? I think I read once that it was a measure of
something like an automatic gain control--when the reciever hears a
strong signal, instead of using lots of gain, it turns down it's own
gain control, and so this "unbiasing" is what is shown by the S meter.

Thanks for the info.

Hello all, just a quick question. Being short on time, I am looking
for a CW filter that would go after the audio stage. I know I could
design one myself, but I would rather just find someone else's already
working design, and go on that. It has to be passive, and capable of a
a watt or two of audio. I plan on adding this to my 2m multimode, which
does not have a cw filter internally, and also would like to use on my
Ten-Tec 40m qrp radio, which has a kinda wide cw filter. Thanks.

Amen. In this day and age I want to be as lenient as possible
on the definition of "homebrew" - partly because few people
ever build anything anymore, and partly because I can't
stand the elitist crap that goes with making distinctions
between "built from a magazine article", "built from a kit",
"personal design from discrete components", "personal design
with VLSI", and so on.

3151. F.S. Collins Parts

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-22 00:00:00 UTC
From: "Alan D. Gray" <agray@voicenet.com>
Message-ID: <36F65B32.FDF2049C@voicenet.com>
Source record: 72142

I have the following Collins parts for sale (all are new and unused original Collins parts unless otherwise indicated):

F455J15 1.5 khz Mechanical Filter for the 75A-4 $295 each

Retainer Clips and Hardware for 75A-4 Mechanical Filters $15 each

Original Manuals for the KWS-1, 75A-4 or 51J-4, (Used, excellent condition) $65 each

Beryllium Copper Band and Spring Assembly for the 75A-4 or KWS-1 PTO $50.

F250Z3 3 KHZ Mechanical Filter for the KWS-1 (used) $250.

4:1 Gear Assembly for the Vernier Knob on the 75A-4 or KWS-1, complete with instruction manual $70.

Dial Glass for 75A-4 or KWS-1 $22/set

Red Pointer for 75A or KWS-1 Slide Rule Dial $25 each PTO for 75A-4 $325

PTO for KWS-1 $325

Jensen Speaker for the Collins 270G-2 or 3 or 312A-1 or 2 $50.

Collins 115 V.D.C Antenna Transfer for the KWS-1 $150.

Knob Set for the KWS-1 (Includes Main Tuning Knob) $75.

Knob Set for 75A-4 (includes Main Tuning Knob) $75.

Main Tuning Knob for 75A series receivers $22 each Knobs for the KWS-1 & 75A-4 $7 each

KWS-1 2500V, 1 Amp. Fuses $6 each

Bearing Sets for KWS-1 Blower Motor $24. KWS-1 Cable Set (Used, Excellent Condition) $24.

Vernier Knob Sets for the KWS-1, complete with gears $250.

75A-4, KWS-1 and 51-J Escutcheons $95 each

Round Kilohertz Dials for the KWS-1 and 75A-4 $65 each

3TF4 Ballast Tubes for KWS-1 $35 each

6AS7/6080 Regulator Tubes for the KWS-1 Screen Supply $5 each
3B28 Rectifier Tubes $35/pair

CP-1 Crystal Pack for the Collins S-Line, complete with gripper tool $250.

Many other KWS-1 and 75A series parts- Transformers, IF cans, gears, doors, emblems, sheet metal, manuals, etc. Inquire.

Alan, W3BV

The other issue is one of motivation - in this day and age, home-
brewing such a device is not cost-effective (while a better antenna
may be *very* cost-effective). What is the poster attempting to
accomplish with such a project? They won't save any money, and there
are better ways of learning about VHF power amplifiers.

The original post suggests that the poster is about to make a
costly mistake.

Originally the S unit was purely subjective. It originated back before
there was such things as S meters. It went along with the RST report that
is still used by CW operators today. (Readability Strength Tone)

The strength of a signal was judged by ear on a scale of 0 to 9, with 9
being a perfectly readable clear signal with no apparent noise. The 0
would, obviously, be a completely unreadable signal.

Then sometime in the 1930s, I would guess, someone put a meter on the front
panel of a receiver and hooked it to the IF stage so the meter would move up
and down with the strength of the signals. They marked the meter with the
numbers 0 to 9. Sometime later (1960s?) someone else decided to put the 9
in the middle of the receiver scale and add some extra numbers to the right.
The extra numbers where supposed to be in dB greater than S9. It was then
possible to tell someone that their signal was 20 dB greater than perfectly
readable! Really makes 'sense' doesn't it? ;-)

I believe it was then in the late 1970s or early 80's that it was decided
that 1 S unit was equal to a signal change of 6 dB. Remember, however, that
dB means 'a ratio to something expressed as a power of 10', so you still
need to know what the receiver maker used as the 'something'.

You are correct, I believe, in that most modern receivers use the AGC
circuit to drive the S meter, but as far as using it to accurately measure
signal strength I am highly skeptical. Maybe there is an absolute standard
for S units, but I am unaware of it. Unless it is a scientific grade
receiver it won't mean much anyway, with variations in frequency, linearity,
temperature sensitivity, bandwidth, reception mode, etc.

In summary, S meters are OK for making relative measurements only.

If I recall, you can also use a fixed resistor in the supply line, or possibly a resistor and an inductor in series. The advantage of using a resistor is that the impedance is theoretically the same at all frequencies.

I believe they recommend using a resistor in series and a capacitor in parallel on the supply line. There is a description of how to calculate the correct value in the MiniCircuits RF designers handbook.

By the way, how many of you know that a male N plug will plug into a female BNC socket? They were intentionally designed that way.

N, C (somewhat rare), BNC, and TNC where all designed by the same two guys, Mr., 'N' and Mr.. 'C'. Perhaps someone else on the group knows more details on the story.

Yes, S meters measure relative signal strength by metering either
the AGC line of the receiver, or for FM receivers, by measuring the
limiter current. We can say with considerable assurance that a
reading of S2 represents a stronger signal than a reading of S1
(on the same antenna and receiver), but we can't go much further
than that without knowing more about the particular setup.

In theory, an S unit is a 6 dB signal strength change. In practice it
rarely is because few receiver AGC systems have a true log response.
Also in theory, S9 represents 50 uV across 50 ohms, but again that's
rarely the case. Receiver gain distribution, and the variance of that
from one frequency to another, makes such a determination quite
uncertain. (There's a different S meter scale defined for VHF receivers,
but that's similarly not well followed. It defines S9 as 5 uV across 50
ohms, and an S unit as 2 db. That's more appropriate to VHF/UHF
signals.)

It would be possible to make a calibration chart for your receiver to
conform to these specifications, by feeding the receiver a signal from
a calibrated signal generator and step attenuator, and noting down
the S meter reading at each power increment on each band, but few
amateurs do. (I have, which is why I know most amateur equipment
reads far from the standards.)

So the only real value of the S meter is to indicate that one signal
may be stronger than another by some ambiguous amount. That's
often sufficient for RDF work where you're only looking for a relative
peak or null in antenna directional response. But unless you've done
a calibration chart for your particular setup, don't depend on S meter
readings for antenna front to back measurements, or comparative
gain figures.

I've found in doing calibration charts that the amateur equipment I've
checked can vary from 1.8 dB to 8 dB in what it considers an S unit,
and that can change on the same receiver from one S unit to another,
IE S1 to S2 may be a very different signal level change than S8 to S9.
I've also found as much as a 10 dB difference in what a receiver
considers S9 from band to band and receiver to receiver of the same

model. Receivers of different makes can have even wider variances.

What I'm trying to say here is that the S unit, and S meters, have very little utility as accurate measures of signal strength unless you go to the trouble to hand calibrate the particular unit you're using. They are, however, useful for a relative indication of where peaks and nulls occur in an RDF system, and as a very crude relative indication of signal levels delivered from different stations to a particular receiving site.

I am planing on replacing the (4) 6LQ6's in a Dentron 1000B amp with (4)
31LQ6's.
Is there any problems with doing this , or does anyone have any suggestions
as to the best way to do it?

i.e. should I use a filament transformer or just wire them in series and run
off of 120... ?

The main reason I am doing this is that a 31LQ6 runs $5.00 a piece verses
the 6LQ6 @ $20.00 + !!

S meters monitor receiver AGC voltage for those receivers employing
AGC, and monitor limiter current for those receivers having limiters,
IE FM rigs. Since most foxhunting is VHF/UHF, and is done with FM
radios, it is the latter you want to monitor.

You'll need a schematic of your receiver to determine where you can
tap in to monitor limiter current. Many of today's radios have an IF on
a chip, which may or may not have a limiter current monitoring point.
This is typically labeled as a RSSI pin on the schematic. This will usually
not be connected in a receiver lacking an S meter. You can consult the
chip maker's data sheets to see what voltage or current is output by
this pin for various signal levels, then build a suitable metering circuit
to show that in terms of S units. I can't be more specific than that without
knowing the particular radio you're using.

For example, I use a BC 780XLT as a general purpose portable service
monitor. Its IF chip has a RSSI output with a 70 dB log response. I brought
that out to a separate meter panel which also has a meter which monitors
the zero center discriminator voltage. So I can measure both signal strength
and frequency error. I had to make up a set of calibration charts, however,
because the scanner gain is different on different frequency bands. I also
brought out the buffered LO signal to a step attenuator to use as a wide
range signal generator (I have to calculate the offset from the displayed
frequency in my head, of course.)

It dawns on me, however, that what you may really be wanting is a field
strength meter. That's a simple passive diode detector driving a meter
movement. The circuit is in the Handbook. It is very useful when you
get close enough to the fox that your receiver limiter saturates.

> Thanks for the info.

You're correct about the AGC circuit and what it does.

Virtually all amateur receivers have an S-meter, and the units on it are universally called S-units. The S-meter simply shows the AGC voltage, which is only approximately logarithmic, and varies a great deal from manufacturer to manufacturer and from model to model. The S-units on my Icom 730 vary from 1.3 dB near the bottom of the scale to 4.0 dB near S-9. The "10 dB" marks indicating signal strength over S-9 are from 5.6 to 13.5 dB. (This is for the band where I measured it -- it might be different on the others.) I've seen S meters on some receivers which have a reasonably constant 5 dB per unit, so you can see that a report of signal differences in "S-units" carry no quantitative information. Some writers, for reasons which escape me, like to define a unit of measure they call an "S-unit" as 6 dB. The difficulty with this is that people think it's the same as the marks on their S-meters, which of course it isn't. Quantitative differences given in dB don't carry this ambiguity, yet the "S-unit" persists in the amateur community. You'll never see the "S unit" used as a unit of measure in any professional publication.

>Ten-Tec 40m qrp radio, which has a kinda wide cw filter. Thanks.

A fully passive design can be made with surplus 88mH telco toroids and
capacitors configured as a Pi section filter. This was popular 35 years
ago for RTTY. An *old* Handbook should have the circuit, or any filter
design program can give you the capacitor values for a fixed frequency
unit in a jiffy. You'll have to dig through some old timer's junkbox to find
the toroids (you'll need 8). I've got some, but I'm hanging onto them for
an ELF project (60 Hz notch filter).

In more recent times, an active opamp filter would be used, followed
by a chip audio amplifier to boost the signal back up to speaker level.
The Opamp Cookbook, or a more recent copy of the Handbook, would
have these circuits. Look for a state variable filter. This will be cheaper
and smaller than the passive approach, and tunable too.

Today, of course, we'd just use a DSP filter. There are a bunch of
them available new or used. Radio Shack made one that was good
as a filter, though it didn't do noise suppression or hetrodyne elimination
like the better DSP units. But it was cheap, and had a speaker amp and
speaker built in. It closed out for $35, and you should be able to find one
used for less. There's also a kit available from a W9 I think, and of course
a number of W&T units by Timewave, JPS, MFJ, etc. That's the high price
spread of course. You can also use a sound card and a program on a PC
(there is some freeware). This is a far cry from the passive unit you wanted,
but it is the more modern way to do the job. Newer equipment has DSP
filtering built in.

3164. Frequency counter circuit required

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-22 00:00:00 UTC
From: David Cunningham <D.L.C@btinternet.com>
Message-ID: <7d65op$o5l$1@mendelevium.btinternet.com>
Source record: 72155

Thankyou to those who replied to my last message regarding frequency counters. Although it may well be cheaper and easier to buy a second hand model, I would still rather make my own; The experience gained would be as useful to me as the finished project. I am new to digital electronics and would rather start with something
simple, using 74LS series TTL, rather than a more complicated microprocessor, and the counter need only work at frequencies as high as, say, 30MHz. I intend to use the 74LS90 and 74LS48 for each display digit, using the divide-by-10 output of each 74LS90 to drive the next digit. I am unsure how to make the input amplifier and gate/reference oscillator, however, and would be grateful if anyone could help.
Thanks for your help.

>The main reason I am doing this is that a 31LQ6 runs $5.00 a piece verses
>the 6LQ6 @ $20.00 + !!

I did exactly the same thing for exactly the same reason.

Worked fine.

My first iteration did put the filaments in series and across half of
the primary, but much (well received) feedback indicated that this was
a serious safety hazard should there by (somehow) a plate-to-filament
short or other fault - the 1kv plate could find continuity to the AC
mains. However, it worked fine other than some RF leakage through the
mains. The next pass just mounted a 24V 2A filament xfmr on the back and
series it with the existing 6V filament winding. I did find that ample
bypassing of the filament lines was necessary in both cases to reduce RF
leaking out of the power lines. The final result (with ECG 31LQ6's
available at the time from antique electronic supply at $4.50 each) was
as expected, although I suggest taking GREAT pains to label the amp
internally as to the odd filament voltage so as to avoid someone
destroying 6LQ6's in it in the future.

PS as I recall it took two passes with Antique Electronic to get really
"NIB" 31LQ6's; the first batch were an assortment of tubes from various
labels, none quite the same, and they worked poorly. The replacement
batch were all identical and worked great.

Jim OM,

I would like to add my voice to the chorus that from personal
experience, homebrewing and modifying has essentially eliminated me as
an interested buyer of most factory-made rigs, particularly new ones.
Advertisers in magazines such as QST certainly do not like to hear this,
although the percentage of homebrewers out there is certainly low, so
there is no real threat. But as homebrewing becomes easier and easier
(which it certainly is today, compared with days of yore!), that could
change; who knows?

That seems to be what I am hearing. I was hoping for something easy to
do, something I could just throw in-line, but it is starting to sound
like I will have to actually do some work. Sigh. Guess I oughta find
that manual for my Icom 245 so I can start to figure out what I can do
(and also so I can adjust the sidetone on it, if it does have it).

On a side note, when do you think us amateurs will start measuring actual signal strength? Although that would be funny--I've got you at -136dBm, etc. That would be far more qualitative, but I guess tradition is hard to break.

And, as a departing remark on S-meters, is it just me or if I want to talk to a repeater w/my HT, if the S-meter isn't pegged at beyond full strength, then I don't talk to that repeater? I know that is mostly due to my "slightly better than a dummy load" rubber duckie. Anyone else notice that?

3170. Rubber duck antennas

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-22 00:00:00 UTC
From: Shawn Upton <supton@eece.maine.edu>
Message-ID: <36F6A59C.2781@eece.maine.edu>
Source record: 72161

How do the manufactures make the antennas 50 ohms? I mean, what kind of matching network do they use to make up for the minimumal ground plane? My friend made his own 1/4 wave antenna for his HT, and noticed that it made a huge difference between holding the radio (and providing a ground plane for the antenna) and not holding the antenna (loss of signal strength, etc).

I played around a store bought 1/4 wave antenna, to see if I could improve it by using some coax sheild (w/o any of the other coax stuff in it) to provide some ground radials. It seemed to improve it, but the SWR did not decrease that much, went from 1.5 to 1.1.

I'm kinda interested in this, as I've noticed (being in a area not populated by repeaters) that my HT is a bit range limited. I would like to do some work on antennas to get more range, hence my questions.

Laura YL,

Elitist is not a bad word; it isn't 'crap', quoting you directly. It
is, however, not "PC" currently, and perhaps this is what is really
important to you.
Elitism is often a motivator which can make a person strive to belong
to a group of those who have achieved what the individual finds
desirable or admirable. It is a positive human trait, not a negative
one as you seem to believe. To some non-achievers, anyone identifying
himself (or, if you will, herself) with a group of achievers is an
'elitist', a negative sense of the word. The common-sense term for this
type of envy is 'sour grapes'. I see examples of it every day, and you
remind me that it is evident here on Homebrew also.

Shawn --

The expert on passive filters is:

Ed Wetherhold, W3NQN
1426 Catlyn Pl
Annapolis, MD 21401-4208
Phone: 410-268-0916
Fax: 410-268-4779

He sells CW Filter kits and 88mH toroidal inductors.

I recently bought a CW filter kit from Ed which cost $22 and seems to have about the effect of the 500Hz CW filter on my old Kenwood rig.

If you're looking for an active filter which can be put into your QRP rig right before the audio amp, you can get a kit from Dan's Small Parts (he has a web page) for $10 plus shipping.

Good luck & 73

There isn't any way to keep the antenna at or even near 50 ohms with
all the variables involved. What they do is design the output stages
to tolerate extreme mismatches without blowing. The design compromises
to get this ruggedness are probably why most HTs are only around
20-30% or so efficient, even when driving a perfect 50 ohm load. The
loss in most HT antennas and other elements in the antenna system does
help stabilize the impedance, but I imagine it still gets pretty wild.

The reason for this is probably that the repeater runs a whole lot
more power than your HT, but doesn't have that much better of a
receiver. This seems common for repeaters.

Building and using a simple step attenuator is beyond the capabilities or interests of most hams. So I think that will happen only when the receivers have a meter on them that measures in dBm. And I don't think that will ever happen because hams won't pay for it.

Roy Lewallen, W7EL

Sorry, I answered that in response to another of your postings. The reason is probably because the repeater power is a lot more than your HT's, but its receiver isn't that much better.

It is better to think of it as an asymetrical dipole. The rubber duck forms half of the dipole and the circuitry inside the HT forms the other half. Rubber ducks do not necessarily have to be 50 ohms, particularly across the entire band

>I played around a store bought 1/4 wave antenna, to see if I could

Do you mean a 1/4 wave HT antenna, or a ground plane? If you are talking about fixed station use, put up something bigger than a 1/4 wave---possibly even a small yagi or quad.

>
>I'm kinda interested in this, as I've noticed (being in a area not
>populated by repeaters) that my HT is a bit range limited. I would like

Well, yes. HT are meant for short range use. There are long rubber ducks available that give a few dB improvement over the short ones. There are also collapsible quarter wave antennas and, if I recall, even collapsible 5/8 wave whips. All of these are, in my opinion, an attempt to get an HT to work somewhere where it was not intended to be used---outside the prime coverage area of a repeater.

In some ways we already are. The FCC has imposed radiation exposure limits
and we are at least supposed to estimate (by calculation) the field
strength. Field strength is also needed to measure antenna patterns
accurately.

>And, as a departing remark on S-meters, is it just me or if I want to

All S meters are different, even between samples of the same model. If your
S meter has to be pegged to work a repeater would say that it is of little
use.

I use MC3356 S-meter detector -displaying 0-70dB above 1uV, and since
background noise level is 10-20dB below 1uV, one have to add some to
the reading. However very few stations on HF are 54dB above background
level on my FT-902, so using this log.meter you risk that many
amateurs mentions behind your neck that you have a bad transceiver.
Hardly believe it is possible to sell equipment which does not lie
about signal strength, 1.3dB per s-unit "indicates" that the receiver
is "sensitive", 5 or 6dB indicates that it is not, very likely Drake
and Collins owners replace the valves too often because they might
believe sensitivity is degraded. Atlas 210-X has 0.8-2dB per s-unit
and sure this aided popularity of this rig.

Reliable information does not help the appliance operator!

That turns out to be pretty easy with modern MMIC amplifiers. Look at the Mini-Circuits MAR-3, MAR-4, MAV-11, and similar parts that offer +10 dBm output into 50 ohms. (http://www.minicircuits.com) You can generally AC-couple directly into a TTL gate once you have +10 dBm or so worth of signal. Not strictly kosher but it usually works. These parts are easy to use -- just mount the MMIC(s) directly to an unbroken ground plane of copper-clad board. (You can also cascade a couple of them to 'square' the signal, for better reliability on slow sine waves.) Some experimentation may be necessary to get the best response on a variety of signal levels and waveshapes, but this is probably still the simplest way to go.

Apart from that, and assuming you want to stick with discrete TTL chips for educational purposes, you will probably want to use 74LS75 (? it's been awhile...) quad latches between your 7490s and 7448s (unless the 7448 has the latches built in? I always used the 7447...) Otherwise you won't be able to look at the results of the last count interval while the next one is in progress. The Forrest Mims "Engineers' Notebooks" available at Radio Shack are great for this type of circuit.

i'm using the MAV-11 as a low-level (15dBm) AM amplifier at 250mHz. the mmic amp is running off 5 volts (max recommended voltage is 5.5 volts) thru a bypassed 0.56uh choke. no instability is observed with the TEK 495 spectrum analyzer.

the Minicircuits manual recommends that the minimum choke impedance be at least 10 times the load impedance at the lowest frequency used. this impedance is in parallel with the output transistor of the MMIC.

keep in mind, if one uses mmics at uhf and above, the leads become appreciably inductive, especially the two ground leads. follow the recommendations in the manual. the ERA-series mmics are good thru 10ghz.

A copy of "Transmitter Hunting, Radio Direction Finding Simplified"
by Moell and Curlee, Tab Books, 1987 is a good place to start.

Amplified sniffers are also a staple project so just about any
years worth of one ham magazine or another will have at least one,
as will an ARRL handbook.

>counting the food definition.
>
Hello folks,

First, there's no hard-and-fast definition. Some would count anything that requires significant assembly as homebrew, including kits with highly detailed instructions. Others don't count anything that is not totally home designed and assembled.

I fall somewhere in the middle. To me the thing that makes it homebrew is whether or not significant decision-making and component-prepping had to be done by the builder, AND whether or not most of the assembly is done by the builder.

Kits are not homebrew, because the decisions are usually all made for you, and in many cases the components require no preparation. (Winding toroids is another matter!)

Converting surplus isn't homebrew, because most of the assembly is done for you.

Building an exact copy from a magazine article is a fine-line decision. In some cases, where significant decisions are made by the builder and parts have to be fabricated, it's homebrew. In other cases, where you buy a complete kit of parts and the magazine article is the assembly manual, it's more like kit building.

Restoring/modifying an old piece of gear is not homebrew, even though it may sometimes involve even more work that building.

I use precise terms for the situation. Some of my gear is built from kits, some is converted surplus, some is restored from basketcase condition. Most is completely homebrew and homedesigned. There is no thrill quite like getting on the air and making contacts with gear you built yourself. I've been totally ruined for manufactured gear by the experience. Sold my Ten-Tec Argosy in 1985 and have used nothing but homebrew, converted surplus, kit and

restored-from-basketcase gear ever since.

None of this is meant as a putdown of kits or conversions. Any type of home construction is a good thing.

3192. TVI on Channel 5

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-22 00:00:00 UTC
From: jathatcher@hotmail.com
Message-ID: <7d4g28mil1@nnrp1.dejanews.com>
Source record: 72227

I live along the Southern end of the Salt Lake region, in Orem Utah about 70 miles from the TV transmitters. All channels have near perfect recepition except for Channel 5. Channel 5 suffers from TVI that on screen resembles CB or HAM interference. It is usually worse at night. Sometimes it is bad enough to blank out the picture. When it is this bad usually channels 2 and 4 are also affected to a lesser degree.

I have tried toroidal core snap-ons on the TV's power, a power line conditioner, and FM filter. Nothing. The antenna is mounted in the attic and is a Channel Master "fringe-area" sized VHF/UHF connected to 4 coax jacks in the house using R6 coax cable. It was professional installed. All my TV's including a presumed good quality Panasonic Superflat 27 inch display the Channel 5 TVI problem.

While the picture interference seems to suggest CB or HAM interference (based on the examples I have seen at the FCC web site), I have never heard an operator's voice. Also, on occasion at night, the Channel 5 interference will suddenly clear for about 10 seconds then return when a refrigerator or furnace fan powers on. But on most other occasions, the refrigerator or furnace fan has no effect.

This interference has me baffled. Could there be more than 1 problem?

What could this be?

Hmmm. There are plenty of designs for *active* CW audio filters, most
of which could be placed externally to the rig - just set the rig's
audio gain below the point of filter overload, and adjust audio gain
through the filter.

For a *passive* design, about the only thing I can think of is a
series-resonant circuit for whatever frequency you want to listen at.
The big problem is, the tolerance of components with enough inductance
and capacitance to resonate at (say) 800Hz is *really* wide. You could
buy components that, according to their markings, should resonate at
800Hz, and find them resonating at 300Hz instead... Anyway, the active
filter is probably cheaper, it can be built with a dual op-amp and a
handful of resistors & capacitors..

Source record: 72080

It dawns on me, however, that what you may really be wanting is a field strength meter. That's a simple passive diode detector driving a meter movement. The circuit is in the Handbook. It is very useful when you get close enough to the fox that your receiver limiter saturates.

Gary
Gary Coffman KE4ZV

Gary,

Yes, I'm looking for a way to measure the field signal strength. This circuit you mention, isn't in my local library. The handbook you mention, do you mean the ARRL Handbook, the most recent copy? Perhaps I should just go out and purchase a copy of the handbook for myself.

Source record: 72082

Hi,

I have just released a nice little Software for:
(download from my page)

Read/write/edit any SmartCard like
- async.T=0 (GSM SmartCards)
- sync. Telecards (Phonecards)
- sync. I2C (Towitoko Cards, 2Kbit-64Kbit, ...)
- sync. 2-wire (German Social insurance, ...)
- sync. 3-wire (German Social insurance, Towitoko Card with Pin, ...)
- sync. microwire

Read/write ANY Serial EEPROM
- I2C (24C00,24C01,24C02,24C04,24C08,24C16,24C32,24C64,24C128,...)
- Microwire (93C46,93C56,93C66,93C76,93C86, ... 8 and 16 bit org.)
- SPI (X25C02,X25020,X25040,X25057,X25138,X25170,X25330,X25650,...)

It is developed with and for the makinterface,
but some parts of it might work with some
other interfaces like the DumbMouse, SerProg,
Phoenix, ...

What this has to do with Radio Amateur :)))))

These nice little EEproms are in almost every
device today. In your GSM phone (containing
the byte for activating the engeneering menu),
in your DVD player (containing the country
code), ... and of course in EVERY Radio Scanner
and Radio Transciever.

I have read (and written to) without problems
the EEproms on my TM-V7 and IC-Q7.

And I am VERY disapointed in ICOM.

The EEprom is used only 25%, the rest is EMPTY.

I don't understand the world any more, instead of
pushing the technologie to the edge, ICOM is cutting
the Frequency range, the number of memorys, ...
and the Hardware is all there.

What a shame, in the intention to sell the IC-R2
they have crippled the IC-Q7.

Well now I am playing a little with the CPU, the
M38267M8L-209GP, I have found the assembly language
manual, ... and with a little luck we will be able
to write our own firmware soon.

And I bet my Firmware will be better then ICOM's, :)
it will have 800 memorys, 80 scan edges and will
cover 0.5-1.6GHz :), and I will help ICOM a little
bit, I will make the IC-Q7 the best mini HT :)))))

Please don't ask my about the possibilitys the
EEprom reprogramming will offer for the IC-Q7,
I have to explore a little bit (In my free time)

The Software was tested with every SmartCard and
EEprom I could find, play a little with the
Software and report any bugs, sugestion, ...

Be advised.

In the US modifying a receiver so that it will receiver cellular
transmissions may result in undesirable legal side effects.

Source record: 72092

The other half of the antenna is the outside of the box containing the receiver + the hand holding it + the arm + ... A sweaty palm can make a lot of difference. As Roy said, the RF output stage is designed to survive severe changes in load impedance. If you bend the antenna through 90 degrees and make an inverted-L out of it, it will most likely still maintain solid communication.

Most amateur full-size antenna systems are just as tolerant to misadjustment, abuse and installation errors. That's why the bands are so cluttered up with people chatting to each other so easily. The real art and skills of radio communication lie in preventing PA output transistors from blowing up.

I think I need a better description to know what "they" are like.
Since you ask about something that seems to be particularly "HP"
I'll hazard a guess.

If the connector has the same coaxial dimensions as N and is sexless;
that is if each of two mating eonnectors are identical, you may
be seeing an APC-7 connector.

The 8410 network anazyzer used these.

Don,

I know EXACTLY what you are talking about. I am Yaecomwood's worst nightmare: the active radio amateur who can't/won't even consider buying their products. And in some ways we ARE a real threat, because we may "infect" others. The QRP folks are almost all kit builders/modifiers/homebrewers, and their numbers are growing. I would be very surprised if the Elecraft K2 (an excellent kit rig) is not a smashing success. If Elecraft makes an optional 100 watt output module (please do!), they will be right in the mainstream market.

I started building rigs because I had almost no money for radio (Novice at age 13), and could build better rigs than I could afford to buy. Now it's 32 years later, and I'm still building rigs. A tough habit to break!

Since 99.9999% of HTs have plastic cases I did not consider the hand and arm as being part of the antenna, although it would certainly have an effect---same thing as putting your 40 Mtr vertical next to a steel frame building.

It is possible to design a helically loaded vertical antenna that will have 50 ohms impedance, but then:
1. Mount it with (essentially) no ground plane
2. Place it 2inches from your head (including eyeglasses!!)
3. Change to a different repeater frequency

...and you have absolutely no idea what the final amp is looking at!

Shrug. I was more concerned with the level of divisiveness and
general bickering and infighting in ham radio. "Political correctness"
(usual translation: "I have nothing meaningful to say") has nothing
to do with it.

If you want to hang out with your friends and compare how big
your, uh, radios are, go right ahead...

I know that most HT mikes will not work with most CBs because they use different types of microphones (I don't remember the names.) I need to use an HT mike on both my HT and my CB (using a switch to switch back and forth.) I was reading either QST or 73 years ago and saw a schematic for a converter which one could use between the HT mike and the CB. I can't find the article. Does anyone know where I can find this article or a schematic for this device.

Thanks and 73,

Do the APC-7 connectors screw together? Our school here has some old
microwave equipment which has sexless connectors, but they have to be
pushed on/pulled off. If these connectors are not APC-7's, then what
are they?

Hello--
These might be General Radio (GR) 874 connectors; both inner pin and
outer shell use a hard-to-describe split-cylinder design.

If anyone needs replacement center pins for these connectors, I can
offer some at a reasonable price.

73,
Brad AA1IP

Hello Laura,

I must strongly disagree with being "as lenient as possible on the definition of homebrew". Building a kit is NOT the same thing as homebrewing from scratch. That is NOT a put-down of the kitbuilder - it's just being accurate. To label all types of home building as "homebrew" is an insult to some (the scratch- builder) and patronizing to others (the kit builder). It's electro-political correctness - mustn't use terms that might, just might, offend certain groups, but it's perfectly fine to offend others.

It's not "elitist crap" to use exact definitions. Not in my book.

I make all my own bread. Used to make it all by hand - now I have a machine. The machine made stuff is OK, but not as good as the handmade kind. Both are far better than anything I can buy in the stores. And yes, I make the distinction between machine made and hand made. Because there IS a difference.

How about this definition? Looking at a schematic of your radio, point to any individual component at random. If you can say, correctly, what that component is, what it does, why it's there, what would happen if it weren't there, and how its parameters were chosen, with a score of 90% or better across a run of 25 randomly-chosen components, you're eligible for certification as an Official Homebrewer(tm). If you can't, you're not.

This is convenient because it applies equally to the rig you built from tubes and old TV parts, the rig you built from a Heathkit, and the shiny new 5-conversion Yaesu FT-6000SUX your spouse got you for Christmas. Successfully passing my "test" means you don't have to prove anything further to anyone, regardless of who built your rig and how. This is a state for which one should strive mightily, since it's not "elitism" (the desire to run with the big dogs for no other reason than to be in their private club) or the "who gives a damn how it works, as long as it transmits" attitude that pervades the rest of the hobby. :-)

Really, this debate is an absurd one. It all comes down to motivation.

My employer, Lucent Technologies, is looking for a Senior RF Technican
with the following abilites and experience:

Senior RF Technician Job Description

1. Ability to read schematics.
2. Ability to solder, including small surface mount devices,
and build up RF, analog, and digital circuits in both prototype
and "small lot production" environments.
3. Able to operate various equipment including oscilloscopes,
voltmeters, spectrum analyzers, and RF generators.
4. Familiar with RF design principles and RF test methods for
return loss, transmission loss, output power, matching and RF grounding.
5. Ability to troubleshoot RF circuitry down to the component level.
6. Perform testing of products based upon a starting point provided
by RF engineer.
7. PC competency using word processing and spreadsheets, good
communication and documentation skills required.
8. Responsible for management of engineering lab, including
ordering/stocking of components and lab accessories.
9. Two years minimum previous experience as RF Technician

Location: Allentown, PA

This will *probably* be a 6 month contract position initially, with
renewal or conversion to permanent, direct employment likely
for the right individual.

If you're interested in working with modern digital radio equipment
in a design and development environment, please e-mail me your
resume ASAP. (MS Word or .pdf format preferred, though plain
ASCII, MS Works, or WordPerfect formats cana be handled as well.)

6 Month Contract?? No thanks.
"Temp" or "contract" jobs are for suckers.
I've been there and I'd rather swamp toilets then play the
"Oh, just a few more weeks and Human Resources will get to you!
Honest we're going to hire you in just a few more days!" game.

I can't say about your specific company-- maybe you're the
rare exception that is being straight with prospective employees--
but I've seen companies "dangle the carrot" in front people
while treating them like dirt over and over again.
It's counter-productive and it's immoral. And you have
no rights when you're a "contractor." Employers can do
whatever they please to you, no matter how despicable,
and you can do exactly -nothing- about it.

No RF tech worth his soldering iron is going to put up with it
for very long. How long would YOU work with no medical
insurance for you kids, hmmmm??

Good RF techs who know their stuff and will COME TO WORK and
WORK when they get there are getting *really* tough to find.
Yes, companies can get people who know how to change parts
and just "meat-grinder" them-- sure costs alot
to do that and not much gets fixed, but they can do it.

I'm a darn fine RF tech and I've been a manager working
the very best techs walking the planet, IMHO ;-).
I wouldn't take a "contract" position on a bet,
and I don't think any of my people would have either.
Either pony up the money for wages and benies
or go get yourself a 22-year-old tech school grad who comes
to work about 3 days a week, 2 of which he spends on the phone.

Oh come on now...

David Stinson wrote
>
>6 Month Contract?? No thanks.
>"Temp" or "contract" jobs are for suckers.

For a person who has a steady income from an earlier retirement
(I retired at 40), and only wants to work part time in various fields,
it is a good way to stay busy and interested.

>I've been there and I'd rather swamp toilets then play the
>"Oh, just a few more weeks and Human Resources will get to you!
>Honest we're going to hire you in just a few more days!" game.

Just send the resume and the cover letter, and forget about it.
If they call, and you're busy, tell them tough luck. Why worry,
be happy...

>It's counter-productive and it's immoral. And you have
>no rights when you're a "contractor." Employers can do
>whatever they please to you, no matter how despicable,
>and you can do exactly -nothing- about it.

On the other hand, you don't have to put up with all the
company crap. You come in, do the work, go home. No
additional duties.

>No RF tech worth his soldering iron is going to put up with it
>for very long. How long would YOU work with no medical
>insurance for you kids, hmmmm??

What a crock. How do you think people who build homes
all their life get by? They'd love to get a 6 month contract.
One contract leads to another. If not, you go to work at 7-11
until the next one comes up.

>I wouldn't take a "contract" position on a bet,
>and I don't think any of my people would have either.

Who cares.

>Either pony up the money for wages and benies
>or go get yourself a 22-year-old tech school grad who comes

Now wait a minute, Dean. Before you go off the deep end you have to realize a few things here. Paul probably has never heard any UT0 stations on his local VHF repeater, so you have to excuse his ignorance.

With the 400,000 Indonesian, Filipino, Chinese, and South American CB'ers we have on ten meters now, one more 5 watt signal will do permanent damage to the E layer and ten meters will never work again.

And you have to realize that Paul probably was a CB'er before he got his ham license, so it's his job as a duly licensed amateur radio operator to condem anyone associated with 11 meters in order to squelch any thoughts that maybe he used to operate there....

Finally, Dean, you have to realize that Paul doesn't realize that the CB'ers all over the ten meter band are using Kenwood, Icom, and Yaesu radios and 'export models' of good buddy stuff, so few of them are converting anything to become a pain in the neck.

Or maybe Paul is just like he is because somebody backed up over him with a truck.

And to our friend, UT0IY, yes, you can convert old 11 meter radios to ten meters, but how to do it is very dependent on the type of radio. The old one I converted required crystals be changed, some of the new ones don't. Post the model of the radio you have and maybe we can help you find out how to do it....

>however, and would be grateful if anyone could help.

You could boost things a bit by using a 74F160 or 74F162 as the first
stage. (The 74F90 doesn't seem to exist).

If you can find the various hobby magazines back for the late 1980's,
there are several project articles for counters. Especially in
Radio-Electronics. For a while there, Optoelectronics and Startek
where using project articles as cheap advertising and there are at
least 3 different units in that time period. A lot of them use
high integration ICs for the actual counters, but the input circuits
are useable. One I remember uses a LT1016 comparator for a 50 MHz
input stage. So check to see what kind of fireball comparators that
Linear Technology, Maxim and Analog Devices have available in their
lines.

For the concepts behind counters, there's a great section on frequency
counters in "The Art of Electronics" by Horowitz and Hill, and the
various Don Lancaster cookbooks (TTL Cookbook, CMOS cookbook) will
have something too.

>of signal levels and waveshapes, but this is probably still the simplest
>way to go.

In other words, if your layout is poor, the line out from the MMIC will
ring and you'll find you've got a input amplitude dependent frequency
multiplier in there. Depends on how hard the MMIC gets driven and
how sharp the clipping when it limits.

I got several weeks of entertainment modifying a total piece of sh*t
Datascan brand frequency counter so that it wasn't a random number
generator. That problem was just one of many in that unit. (The PN5179's
on a single sided board made better oscillators than input amplifiers.
And the claimed 1 megohm of input impedance was across a forward biased
clipping diode. And the 7 volt max 74HC IC's run on 8 volts, etc...)

Hi,

I'm on an engineering clinic team at Harvey Mudd College in Claremont, CA. Part of our project is implementing a stanard RC system into a water surface vehicle. Currently, our signal range is just the standard .5 to 1 mile, depending on the conditions. We need to increase this to 3 or 4 miles.

Our plan is to divert the signal before it runs through the antenna matching circuit, and then send it into a linear amplifier. However, I'm having difficulty designing a workable linear amplifier. So I was wondering if you could pass along any hints or suggestions to us.

The signal is a 75MHz signal. You can assume that we have unlimited power for the circuit, and we have a hefty budjet for the project. Also FCC regulations have been taken care of since our project is being sponsored by another government agency.

Thank you for your time.

Cody Machler

Carl,

What's the average starting wage for an RF tech at Lucent? Good techs may be hard to find, but it also seems that the average wage is rather low for a "high tech" position.

I realize that this is partially due to the fact that many techs are non-degreed, having gained their experience at a vo-tech school or through the military.

Paul, such a rude response!

But the apology speaks well of your character--most would not have had the courage to type it. Let's see if we can help this guy (or his radio sport club) out in simple English:

Okay Vostok-Radio, the conversion involves changing the reference crystal in the phase-lock-loop (PLL) circuit to the part you are interested in moving to in 10M. In North America, most AM activity is 29.000 to 29.100 MHz, sideband is from 28.300 on up to 28.700 or so. You can also frequency shift the carrier and operate in the FM portion of 10M from 29.400 to 29.700, but this is a slightly harder modification unless you have one of those FM CB radios that are built for overseas markets. A company named Melco used to offer a kit to make an FM conversion of an AM CB radio that was pretty easy to do. After the PLL's xtal is changed the reference voltage must be adjusted. Harder to figure out is the band-pass filter that comes after these oscillators. The new frequency will be attenuated if this is not changed. Usually it involves just changing a simple capacitor or inductor or two.

The hard part to all of this is understanding the theory behind PLL's and in finding a circuit diagram (schematic) since they are not usually published by the manufacturers and there are so many different models that have been sold. There is a CB web page that sells service manuals for CB repairmen that may help. Try

http://www.cbcintl.com

or just keep asking on these newsgroups if you have more specifics of the circuit you are working on. In the 1970's an American magazine called '73' published many articles on CB conversions. I'm afraid that I am not going to be much help. It has been 15 years since I did my last conversion and I cannot even find my notes.

If you are going to operate illegally, be sure to work from 27.5 to 28.3 MHz, always overmodulate, add echo effects if you can, and try to speak a very fast Spanish or Portuguese so that you blend in with the other operators I usually hear there. Just kidding!

Good luck,

-- John (N0BUP)

Hello fellow homebrews.....I recently completed a homebrew 6 meter 8877 amplifier from radio handbook plans (W6PO design I think). I am having a problem getting more than 400 watts from it. I am driving it with 100 watts and I am only getting about 35ma. of grid current and about 1 amp of plate current, but only 400 watts output. This is not right! I am thinking that the tank circuit is not resonant but the grid dipper says yes, the cathode tuning is working fine. My experience with 8877's tells me that the grid current rises sharply with increase in drive power until you load down the tank circuit. I can only muster 35 ma of grid current but lots of plate current with little increase in power output. I have checked the tube its 100% so its not that. Anybody give me suggestions on where to look for a problem? Please e-mail direct if you can shed some light on the problem...Thanks 73 LOU

Good grief Paul,
One must assume that there is some history of conflict between the two of
you, for you to start ranting away like this.
What an interesting way you have of conveying the spirit of Amateur Radio.
(sarcasm was never my strong point)

I'm curious to as which CB's would make the best subjects for
conversion. I know that it would be better to get one w/SSB (who does
work w/AM?), but I'm more curious about what models work best. After,
why pay $100-200 for a real 10m radio when, if I spend $20 bucks for an
old cb and do $10 worth of mods, I can have something that does the
trick?

Hey, wait a minute! I have held a amateur license for 18+ years and I don't know how to convert a CB to 10M. Actually I have just started using 10M mobile and think it is great fun. I want to put an inexpensive radio in my Jeep and I would appreciate learning the answer to this question.

BTW: He did sign his message with his call, UT0IY.

Yeah, I haven't started looking seriously yet, (I graduate in December)
but most of the ads that I see for engineers either ask for a) 2-5 years
experience or b) 3.5 or better gpa. Now, this may or may not be the
real story, but that's just what I've seen in the quick looks that I've
given the subject.

My senior project is to build an 80m cw transciever; so far, I've been
working on a crystal filter and a dds (w/a pic controller). In the near
future, I'd like to expand my microwaves course a bit and actually try
to communicate across my campus somehow in the 1.2GHz ham band w/some of
the other amateurs on campus. I might even take the spring semester
after I graduate to do some odd jobs on campus so I can bum around and
use the really nice test equipment we have here to experiment some and
further my knowledge of RF. I'm hoping these are good steps in the
right direction.

: Do the APC-7 connectors screw together? Our school here has some old
: microwave equipment which has sexless connectors, but they have to be
: pushed on/pulled off. If these connectors are not APC-7's, then what
: are they?

Yes. Both inner and outer conductors are approximately flush with the
front of the connector (modulo spring loaded center pin) and an outer
nut can be either threaded forward where it engages with the opposite
connector, or back, where it is out of the way so the other connectors
nut can engage. Only one of the two nuts, either one, is used at a
time.

A push/pull connector is something different from APC-7.

The "7" is for 7mm by the way.

Aha! So Lucent is reduced to trolling for resumes on the newsgroups.
Don't they have a human resources department? Lucent is a very
fine company, you'd think they could do better than offer
contract employment to their beginning techs. I think it's time
to review my stock portfolio.

To all that responded, I guess my description could have been better concerning the small RF connectors used in the 8410, 8407 and 8553B pluggins and I am sure much more in that generation of equipment.

Well I think I have confirmed for sure that they are SMC connectors. Now my next challange involves adapting them to the test equipment world, i.e. signal generator, spectrum analyzer, etc which involve standard a BNC, SMA,N etc.

Thanks all for replying
Vince N1VC

Hello OM,
I've successfully converted two synthesized CBs to 28 MHz for CW operation. The first radio was converted by removing the 10.240 MHz PLL reference crystal and replacing it with 10.635 MHz crystal I chose that frequency for no other reason than it was the first one to fall out of the junkbox! It was a good choice, for now Channel 1 is at 28.005 MHz.

The second CB was converted only after I had studied how PLL circuits work so as to learn how to re-wire the 8-bit binary-coded decimal (BCD) programming scheme.

I highly recommend the first method!

Keep in mind that if you change the crystal to get the radio up to 29 MHz, the crystal oscillator will need to be aligned, as will the RF stages.

Hope this helps!
73 from Hawaii, Jeff WH6U

There should be some "ground-plane" in and aroun the RF areas of the
board. Connect the BNC shell to that ground plane with the shortest
lead you can manage (you want less than an inch) and you should be ready
to run coax to your roof-top antenna, 100 foot tower, or whatever!
You will find (with an ohm-meter) that the groundplane is electrically
common with the battery negative point tha another poster recommended,
but short lead lengths are important at VHF.
Good luck and 73 de W1AEL, Allan.

Paul,

UT0IY may well be a valid call sign. Looking at the QRZ New DX page at http://www.qrz.com/wrad/directory.cgi?new_dx I find a couple other UT prefixes listed. I also find in the 5th edition of the ARRL Operating Manual (ch. 17, pg. 90) that the prefix UT indicates someplace in the Ukraine, specifically Kiev.

I'm not up on searching for non-US call signs online. I've no way of confirming that UT0IY is valid or not - but it sure looks like it may be, but of what class/type - I don't know.

Now if this poster had indicated he was some yak-jawed 'good buddy' I'd have to totally agree with your suggestion. In this case though, methinks you've keyed up before listening.

> two cascaded Pi or T networks _for each 20 dB attenuator stage_ give better
> results?

Cascaded Pi's is the normal thing for manually switched stepped
attenuators, usually with BCD or Binary stages, but they use DPDT
switches, does your OMRON come in that flavor with a way to have
50 ohm bypass? or are you thinking two SPDT relays interupting the
stripline?

> formula to calculate the values of the resistors of the "double Pi" or
> "double T" network?

Search engine www.altavista.com with
+attenuator 50-ohm (switched stepped) -audio
finds at #3. 50 Ohm Attenuator Table,Cross Technologies, Inc.

Try contacting Pasternac (Pasternak? Pasternack??) Enterprises.

They are the premier supplier of connectors and connector-series adapters.
No matter what two types of connectors you have, they are pretty much
guaranteed to have an adapter that will work.

I do not know if they have a web page, but it is worth the check.

Probably too much! I've been learning some stuff though, and I have to ability to check in a few minutes--I have a unix box here in my office, which I can leave logged in, with Netscape running, with the ng's going, so whenever I pop in for a minute, a quick click and I have all the new posts. I can quickly scan (I simply erase all the ones I don't want to read) and then read the ones I want, and then go back to whatever.

I'm starting to catch up, but only after organizing my time a bit and working more. It's always an uphill battle.

I think you guys missed my point, though -- nobody, but NOBODY, is going to pass my little "test" without a heck of a lot of hours spent with the books and on the bench as well. "Understanding" electronics is not the same as "doing" electronics. Even someone who builds a complete station from scratch from ARRL Handbook project articles and such could very well fail to pass the test. Likewise, someone with an MSEE but little hands-on interaction with components and circuits would almost certainly fail. I've seen plenty of examples at both ends of the spectrum.

But also note that if you change the reference crystal, the spacing will
be different. Also, the CB sets I've seen use the 10.240MHz crystal to
convert the 10.7MHz first IF to the 455KHz second IF. If you move the
reference frequency, depending on the rig you may move the signal out of
the first IF passband.

The CB sets that I've seen block diagrams of use a mixer between the VCO
and the programmable divider. It's there to simplify the calculations
and/or to get the VCo down to a frequency that the programmable
divider can handle.

They use a harmonic of the reference frequency as the second signal to the
mixer. The real change of the CB set's frequency comes from that harmonic,
not the actual reference frequency. The reference frequency is divided
down to 5KHz or so, and to make much difference at that point would
require a very large jump to another frequency for the crystal. However,

the change at the crystal frequency, especially when multiplied something like three times means the VCO has to move up in frequency by that much in order for the signal at the output of the mixer (ie the input to the programmable divider) to be the same as when the reference crystal was unchanged.

In other words, if you move the reference frequency up almost 400KHz, the injection to the mixer is over 1MHz higher so the VCO moves up that much.

The trick in the old magazine articles was to uncover where the reference frequency is multiplied and fed into the mixer between the VCO and the programmable divider, and cut the signal path. Feed a new oscillator into that point.

This moves the VCO (and the rest of the CB set) higher without messing with the channel spacing. It also will not mess with the second conversion osciilator.

Lucent isn't "trolling" ... I thought I might help a
fellow ham find an interesting, exciting job opportunity.

Sheesh ... like Hans said ... you'd complain if you were
hung with a new rope, wouldn't you?

Lucent's HR department IS working the opening. Like I
said, I just thought I'd try to help a fellow ham.

As for your stock portfolio, If you want to sell Lucent
stock, how many shares do you have to sell? I buy the
maximum allowable under the employee stock purchase plan
every month and all of my 401k goes into the stock fund.
(not to mention my options)

Mike ... the "ad" was for a tech, not an engineer ... and
because *good* techs are so hard to find, many companies
hire them through a contract agency for 3-6 months to see
how they work out before converting them to permanent
employees.

It gives BOTH sides a chance to see how things are going
to work out.

Does anyone know anything about the Daiwa PS300 power supply as far as it being suitable to run an HF rig from??? It sounds ok to me in that it produces variable V of 9-15 VDC and 30amp current. I would appreciate input from anyone familiar with this supply and use for an HF rig. Please email.

Thanks

Ron

Hello John,

All of us should be able to pass that test. But even getting 100 doesn't make
one a homebrewer. How about a title like "qualified amateur radio engineer?"
>
>This is convenient because it applies equally to the rig you built from

Building gear isn't a private club. Anybody can join. The more the merrier!

>or the "who gives a damn how it works, as long as it
>transmits" attitude that pervades the rest of the hobby. :-)

Agreed. That attitude is far more poisonous than anything mistakenly called
"elitism".

I build 'em and I use 'em. Tremendous fun. Look up my call in the SS or FD
(1987-1995) to see how well homebrew-from-recycled-parts gear can work.
>
>Really, this debate is an absurd one.

Not at all. I just want accurate descriptions. Kit building is good. Homebrewing is good. Modifying is good. Restoring is good. I appreciate and applaud all of them. I've done all of them, and I want to encourage other hams to do all of them. What's the problem with being accurate?

> It all comes down to motivation.

Nope - it all comes down to accomplishment.

I have "played with" rubber duckies in my RF lab for a while, and in general,
I consider them as dummy loads that somewhat radiate. Many of them do not even resonate where they should, and body movement affects the resonance a great deal.
Obviously they are great for short range, but if you need any kind of RF gain please consider alternatives. Fortunately, the HT manufactures know
this very well, thus the TX Amp does not typically destroy itself against poor
mis-matches due to the wild return loss of the duckie.

Yep...I have an HP8660C...will that work? It's a synthesized signal
generator w/digital frequency display. The "Q" I'm talking about refers
to the losses in the ferrite core. Not the "bandwith" of the resonant
circuit. In a series LC circuit there should be a Q rise in current
at resonance where the Q is the ratio of the reactance to the real
resistance (i.e. generator impedance + skin effect losses + wire resistance
+ ferrite
core loss). Can this be equivocated to the Q definition: 3dB
bandwidth/frequency?

thanks in advance,

-Charlie W5CDT

Hi Lou,
I recommend you subscribe to the AMPS
reflector at www.contesting.com.
A wealth of knowledge from people that
know amps in and out (Rich Measures,
Carl km1h, others).
Once you subscribe, you can post questions
and get answers.
Sounds like you are pushing the plate current
too hard for the output, so there is some
non-resonance in there, or you have another
resonance on another frequency.
Good luck.
Bennett ko2ok.

Here's how I do it. I make a parallel resonant circuit with the inductor and an air variable capacitor. (Even some mica capacitors have low enough Q to skew results for good inductors.) I couple in and out with 1 pF capacitors, to the signal generator and scope. I measure the resonant frequency (peak amplitude) and -3 dB points. The Q (see below) is the ratio of center frequency to bandwidth.

A reasonable model of the inductor at one frequency is a parallel RLC circuit, where the C represents the inter-turn capacitance. The Q measured by this method is the ratio of the R to XL in this model. If you define a single equivalent L as a combination of the L and C in this model, and the Q as the ratio of R to its reactance, the Q measured by this method will show a bit higher. If you need to find the shunt C, you can derive it from measurements of the apparent inductance of the coil at a couple of different frequencies. The Q I measure with the parallel-circuit method is fine for comparing core losses, since C should be about the same for the same winding on various cores.

An advantage of this method over some of the bridge and null methods is its relative insensitivity to impedances, the test fixture, etc. The only caution is to keep the inductor reasonably well away from conductors and lossy dielectrics.

I whipped up a switchable 3 dB pad to put in line for convenience. I switch it in when measuring the maximum, then swich it out and find the 3 dB points by adjusting the frequency for the same amplitude as before. The input and output of the pad have to see the right impedance, of course.

There are ready-built amplifiers that will work, unless the idea is to build your own. Check with MiniCircuits www.minicircuits.com, if I remember.

If you want to build your own, go to the college library and look up the ARRL Radio Amateurs Handbook. If they don't have one, go to the public library or go buy one yourself (you're on a government grant so you can spend all you want, right?).

If it is to operate in essentially one direction you might consider a directional antenna.

> Thanks for your help.

Stuff like this is covered in all the usual references, like
Solid State Design for the Radio Amateur and _The Art of
Electronics_ - both essential purchases. The first is cheaper. :-)

You may find your input amplifier works out better if you do
it in two stages. The first sets the instrument's input impedance,
while the second generates the logic-level swings for the TTL.
This often means a FET input stage driving a bipolar
switching transistor. Look at the digital display in _Solid
State Design_ for an example. 74LS TTL has the same drive
requirements and logic levels as the TTL they used.

Microcontrollers? Complicated? I guess I'm missing something.

Can someone with a tube reference book tell me what the driving impedance is for a 572B tube (or tell me where I can find that info on the 'net)?

I'd like to try adjusting the input networks on my SB-200, and can do so with the MFJ-259 antenna analyzer but must have a couple of resistors that are the same value as the driving impedance of the tubes (572Bs).

Any help would be appreciated.

Thats funny, dummy loads that sorta radiate. That does make sense;
attenuators are more broadband and present better swr than a tuned
circuit. At the moment, I'm toying with the idea of building a couple
of J-poles, one for my packpack, and one for my bicycle. I'd use the
typical 300 ohm twin-lead for the matching section, but I want to find
some sort of spring steel for a whip--so it will be self supporting, but
have some bend to it. Like the stainless steel whips for mag-mounts and
such. I suppose I could use brazing or welding rod, that would be
cheaper but right now, I'm just toying with the idea of it.

You can find a lot of info on "The AARL Antenna Book".
That's a fantastic book!

I'm wondering if anyone has some advice to a newcomer to QRP and also sorta new to amateur radio....

The last kit I built (with some help) was in 1951 when I was 10 yrs old - a Heathkit AR2, I think it was. I never followed thru on a license till just recently - too busy 'doing life' I guess.

I just recently got my license and now that I'm retired, I have lots of time on my hands to spend on things I love - like radio.

SInce I'm pretty inexperienced with kit building for the 21st Century, do you think I'd be getting in too far over my head with the K2? It certainly is the rig I'd like to ***use*** after consdiering other possibilities (I currently have a Ten Tec Scout). And most of these factory-built rigs run in the thousands of bucks. A complete K2 with all the available options, comes in under $900.

So am I nuts to try the K2 given my limited experience? From everything I've heard and read, this rig and kit sound like an absolutely first rate design job! I only wish the very large, well-know computer manufacturer where I worked for many years, paid as much attention to the user interface, manuals and other details that Elecraft has given so much thoughtful attention to.

Any feedback would me mucho appreciated.

tnx es 73,
Jim

If you can solder and read you can build a K2. Just take your time and check and double check everything. Take the time to tape all resistors and capacitors onto sheets of paper and label the values. That way you don't have to make color code decisions during construction (some colors are hard to tell apart unless you can compare them side by side). IMHO most people get into trouble because they get into all night marathon building sessions trying to get it done in a hurry. I find kit building much more fun if I work on it a few hours a night.

If you haven't soldered in a while get some perf board and resistors from radio shack and practice a little before starting the K2.

You'll find the K2 manual to be very complete. The K2 is an excellent rig.

3319. How to get a repeatable T/R delay?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-25 00:00:00 UTC
From: lrbrandt@statestreet.com
Message-ID: <7deb6n$7pg$1@nnrp1.dejanews.com>
Source record: 72004

Hi All,

I need a XCVR (or separates) that can simply switch between
transmit and receive in a predictable manner.

What I mean is I have a timing critical application where
the T/R delay, whatever it is, is not important. As long as
the delay is constant, that's OK.

The delay needs to be constant within about 1us (.000001 sec).
I've thought of adding a "fudged" time, that is always making
it wait 2 secs or so, this large time would average out any
really small delay variations.

I need this accuracy so I can launch a packet that occurs
after detetion of a packet on another frequency.

(would FCC allow me to "rebroadcast" the signal, I don't
think so but hearing a signal and "repeating" it with your
call (SSID) would be OK.)

I expect a separate transmitter and receiver (on diff. freqs.)
would have the _least_ delay, but again, I need repeatable delay.

I guess a transmitter that uses a digital PTT (+5V on a pin somewhere)
vs a relay (hardware or solid-state) would work in a more repeatable
fashion, but I'll need to test some, I guess!

A way to test this is with existing dual band units. But I'm wondering
if there have been any tests done that can help in selecting a XCVR
for this.

Any ideas post and/or email me!

Tnx es 73,

AA1EA

Hello Steven,

Some of each. We grow (organically) herbs, spices, tomatoes and hot peppers here on RadioTelegraph Hill. (The hot peppers make habaneros seem like sweet peppers - ask W3RV about how I define "hot"). Have also done the sourdough thing. The rest we buy. You know you're serious about bread baking when you buy yeast in 2 pound bags.

Most radio parts here are "recycled" - that is, bought at hamfests or retrieved from dumpsters and the like. Some parts are manufactured - coils are wound, sheet metal fabricated, etc. Made a really neat illuminated drum dial out of a piece of plexiglas tubing six inches in diameter that was given to me. Works really well with the capacitor/dial drive from a junked BC-221 frequency meter.

Better than store-bought!

Everyone in this discussion seems to have some good points.

Those that build from scatch should have some kind of distinction
that sets them apart.

On the other hand, kit builders/circuit modifiers also deserve
some kind of credit.

I have been a designer/builder for over 30 years now. I build some
things from scratch and other things from kits, magazine articles,
etc. I don't believe that my way of designing something is the
best and only way. Sometimes I really like someone elses design,
so I might incorporate some or all of it in something I make.
Sometimes I like the features offered by a kit and don't want
to be bothered ordering all the parts and be put on hold for
months while things are back ordered. The only thing I can be
sure of is that, everything I have is going to have a modification,
sooner or later.

So, why not just let "HOMEBREW" describe the things that are
completely "built from scratch". Let's add another another
word, to give credit to those that may not have the knowledge,
or abilities, to build completely from scratch, but have the
willingness to learn and get their hands in the guts of a piece
of equipment. Why not describe this middle ground with the
word "HAMBREW".

Jim n8ee replied to > Reg Edwards who wrote
> >The other half of the antenna is the outside of the box
> >containing the receiver + the hand holding it + the arm +
> Since 99.9999% of HTs have plastic cases

which provides a layer of lousy dielectric betwixt the circuit-board
groundplanes or the internal metal shield/case and your hands.
At RF, we don't need metal-metal junctions, which is why through-glass
has even half a chance of working better than a duckie in a car. (If an
HT doesn't have decent interal shields or groundplanes, it's gonna
radiate its LO and cause lots of problems ... who ever saw a
plastic case HT with point-to-point wiring? Normal VHF/UHF practice
will at least have all of one side and all the waste space on the
other for capacitive coupling to your arm, although expecting good
practices from someone not using shielding may be asking too much :-)

> I did not consider the hand and arm
> as being part of the antenna,

The case and arm are the counter-poise for an HT. Which is one
reason to be careful with the duckie-on-the-hat extension cables;
I'm going to check mine and see if it sweeps better with a choke at
a suitable distance down from the hat-mounted BNC. I'm not sure I
prefer having the "counterpoise" irradiating my brain to irradiating
my kidney when using speaker mike, but (a) if I were using built-in
mic and onbaord duckie, the head gets it anyway, with the arm/chest
as counterpoise; and (b) if it gets out better that way, I'm
absorbing less.

> although it would certainly have an
> effect---same thing as putting your 40 Mtr vertical next to a steel frame
> building.

More like putting your quarterwave magmount whip on a metal car roof
rather than a plastic one -- that's what it's designed for.

> It is possible to design a helically loaded vertical antenna that will have
> 50 ohms impedance, but then:

I expect they do have 50ohm when tested with a test instrument that
treats it like an HT would (eg MFJ-259 held in hands).

> 1. Mount it with (essentially) no ground plane
> 2. Place it 2inches from your head (including
> eyeglasses!!)

I think we're agreeing here, if you design it as a free-space 50-ohm
radiator, you're assuming a choked/balun'd feed and free-space,
which you won't get, so design for the environment and allow for
that in testing/measurement too.

Is England part of Europe? (I guess a couple parliments are debating that very question :-) Last I'd heard, receiving POLICE signals was unlawful in Britain, and they were campaigning for that right. They may be able to buy a DC-Daylight receiver, but turning it on may be illegal. (Were they successful?)

Note one reason HTs for the 220 ham band aren't commonplace and aren't covered on most scanners is that frequency band is used for Japanese police, so the usual manufacturers have a major govermental disincentive to include them. Not written into law perhaps, but not included in the cheap scanners either.

3326. Charging NiCADs

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-25 00:00:00 UTC
From: Shawn Upton <supton@eece.maine.edu>
Message-ID: <36FAE5A7.6231@eece.maine.edu>
Source record: 72011

Hello all,
I'm wondering about how to make a low cost NiCAD charger for charging up AA's. I have a wall cube that likes to put out about 17V (w/a slight load on it) that I used recently to charge up my lead acid 4Ah battery. For charging the lead acid, I simply used about 50 ohms to limit the current to something like 110mA, which took about 4 days to charge. Can I do something like that to charge up NiCADs, or do I have to spend money on this project? I don't want to buy a fast charger; I'd rather have a slow charger and get more life out of my batteries.

I have heard that some hams are connecting the internet phone program from volcaltech to a radio. Does anyone know how this is done?

3333. Class C vs Class D vs...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-26 00:00:00 UTC
From: Shawn Upton <supton@eece.maine.edu>
Message-ID: <36FBBA47.6956@eece.maine.edu>
Source record: 71929

I know how Class A, AB, and C are biased, and the rough operation of each, but what are the Class D and up amplifiers? From my understanding, class c is driving with a 50% duty cycle square wave; could the class d and higher amps be driven with a non-50% duty cycle wave so as to reduce the harmonic contents of these amplifiers?

>and let 'er rip.

This would be about 45 to 50 mA for a AA, although there are higher capacity cells around. At this rate it typically takes 10 to 15 hours to fully charge. An easy way to check is to take their temperature. If they feel warm then they are done.

Start with a high frequency crystal oscillator. Build a divider circuit
using digital logic to divide it down to the desired time interval. WHen
you receive a packet start the divider. When you get the output pulse it is
time to send. Even a cheap crystal would give you +/- 0.02% or better
timing.

>(would FCC allow me to "rebroadcast" the signal, I don't
>think so but hearing a signal and "repeating" it with your

>

That is what a repeater does. That is also what a digipeater (digital
packet repeater) does. Look up packet radio on the internet. There is lots
of info on it.

I assume you are talking about retransmitting a legitimate amateur radio
signal. Anything else would be illegal.

>I guess a transmitter that uses a digital PTT (+5V on a pin somewhere)
>vs a relay (hardware or solid-state) would work in a more repeatable

Some IF/RF noise blankers use a delay method so that when a noise pulse appears the signal switch is open-circuited before the desired signal arrives at the switch.

One scheme uses a glass delay line for the desired signal. A multi-section LC lowpass- or bandpass-filter also delays the signal.

An active opamp filter could be used at audio frequencies.

>--

No, a Class C is driven with a less than half-cycle sinewave.

Class A is biased so that the tube/transistor is always conducting. The signal (I am assuming a sine wave here) is amplified on its entire cycle. Class B is biased so that the tube/transistor is conducting only on (exactly) 1/2 cycle of the sinewave. Class C is biased so that the tube/transistor is conducting on less than 1/2 cycle.

Class AB is between A and B, in other words the tube is conducting over more than 1/2 cycle but less than a full cycle.

There are also sub classifications that you will see, such as AB1, etc. These have to do with exactly how much of the cycle is in conduction.

In the newer amplifiers, such as Class D and E, the tube/transistor is driven in to saturation on the peaks and completely cut off on the low points in the cycle. They are basically acting as a switch.

The trade-off in all this is between efficiency, power output, and distortion. Class A would give the smallest distortion but has the lowest efficiency. Class D/E would have the highest efficiency but the most distortion.

I, myself, are not completely familiar with the details of D, E and related classes. Perhaps someone else on the group can give you more details.

I have at least 20 or 30 round meter movements from military v.o.m.s. Rugged steel constr with AC V, DC V, and ohms scales. 4-1/2'' o.d. with 3-1/2'' face, $4.00 each plus UPS. All are 50 uA movements made by Bruno, QVS, or Phaostron. The scale can be removed and reversed (or painted over) for a custom power meter, ammeter, etc. Four styles available, with blue or black bezel, and with entire meter visible under clear cover or with bottom third coverd by the bezel. Also have a few with an extra set of terminals to detect a "pegged" condition, for $6 ea. NOTE: Please REPLACE the "50" with "snow" to spell "snowhill" in my email or call 334-347-5281.

I'd like to give a caution about using some of the professional texts for phased-array information. Much of the phased array development has been done for very large arrays (like the military one I worked on many years ago which had 10,000 transmit elements and around 5,000 for receiving). In these arrays, the environment of all the elements except ones on the very outside is essentially the same, so feed systems can be designed with the assumption that all element impedances are the same. This assumption underlies a lot of the analysis of large arrays, but isn't valid for most amateur arrays of a few elements. Making this assumption can lead to arrays that work very poorly.

In contrast, the element impedances of an amateur array are often very different from each other, and this has a profound effect on the required feed system. In professional texts, look in the sections devoted to AM broadcasting, such as Chapter 25 of Johnson (_Antenna Engineering Handbook_) or Chapter 20 of its predecessor edited by Jasik. Like amateurs, broadcasters also use arrays of a few elements. Their feed systems tend to be complex, and made to operate on a single frequency after a lengthy adjustment procedure. But their methods are valid and applicable to amateur arrays. (For examples of this approach see Lee, _Vertical Antenna Handbook_, published by CQ.)

A number of amateur sources have already been mentioned. You might also take a look at "The Simplest Phased Array Feed System -- That Works" in the _ARRL Antenna Compendium_, Vol. 2.

Jim, do you mean there's now a third edition of Kraus? The second edition has been out for 11 years now.

Your "Class C" is actually Class D - in effect, a high-speed SPDT
switch between the positive and negative power rails and the output.
Such amplifiers are easy to make with power MOSFETs. There was a
20 watt transmitter in Radio Communication a couple of years ago
that used push-pull Class D IRF 510s. Just about the most watts
per dollar I've ever seen. :-)

You're not going to find much on the subject in the amateur
literature - only the occasional article here and there - but this
sort of stuff is well covered in the professional literature.
Check the IEEE publications in your school library.

I agree, this is the first message I saw the very first time I checked this ng. Funny thing is, I am considering building a 2M HT amp. Why? because I have the time, so why not. If I buy one, then I still have to find a project to keep me busy. Some people homebrew for something to do, not just to save $$, although I am usually a big fan of saving money..

Now, for the relevant part of this post, there is an article in the '99 ARRL Handbook on building a 2M amp for an HT. I have a dead dual band radio that I can rob the amplifier module out of.

Hello. I have a chance to buy one of these and was
wondering the following:
Is it solid state or tube type?
Is it CW only or if voice capable AM or SSB?
How many watts output?
The approximate age.

This is a marine lifeboat radio with a crank generator and
antenna kit in a portable suitcase.
I thought it might be a novel rig for field day, emergency
use or just for fun. Any info
greatly appreciated.

Randy.

From: Brian <schousek@geocities.com>
Message-ID: <7dhpqp$d9m$1@jair.pressenter.com>
Source record: 71951

Well I had the hardest time doing that in the graphical version of Pspice for a long time (I could easily do it in the text based spices, but I guess that starts to show my age.)

A solution to your problem is to place a parameter block (PARAM) on your schematic via place part (ctrl-P).
-double click on the parameter block, and set Name1 to SET and Value1 to 1p
-now place your capacitor and double click on the capacitance value, set the value to {SET} (note the curly brackets around the word SET... they are above the square brackets [] on your keyboard.)
-Now go into the Analysis-Setup menu. Click on the Parametric button
-Set 'Swept Var. Type' radio button to 'Global Parameter'
-Set 'Name' box to SET (no curly brackets)
- choose appropriate start, end, and increment variables, and your sweep type
-now run your simulation and be happy- now that you know the basic steps you can start to improvise

The magic is in the curly brackets around SET. I used the full version of Pspice at a former job and hence had complete documentation, but it was still difficult to track down this technique. Don't feel bad if it wasn't apparent :-)

>Im trying to stabilize old Ten Tecs with PLL vfo-any help appreciated.

You might want to consider an improved version of the 'huff and puff' stabiliser originally developed by PA0KSB. See 'The "Fast" Digital Oscillator Stabilizer', by Pete Lawton, G7IXH, QEX Nov/Dec 1998, pp 17-23.

Unless the drift rate of the original TenTec oscillator is truly horrible, then this should sort it out. You can get a copy of the magazine from the ARRL for $4 shipped. It is not mentioned in the article, but you can get a PCB from FAR Ciruits <http://www.cl.ais.net/farcir/> for $11.

Message-ID: <09990225164621.OUI17.ejune@intuitive-data.com>
Source record: 72019

A 555 timer might do the trick. The application notes for the chip will give you all the circuit examples that you should need. Not sure if you can maintain a 1uSec repeatability spec, but if you choose components that don't drift much with temperature, you might be OK.

John,

I can guarantee you I'd get at least a 99 score on your test. On every component in every piece of gear in my station. Been that way since I was a Novice.

Thanks. It seems that I can do a trickle charge at about 50mA for
something like 10-15 hours, since that is the it used to be done. Maybe
I should look around for a used charger; I just don't want to pay $30
for a quick charger that might result in less battery life; and also
because another NiCAD pack for the HT would be a cheaper investment than
buying the 6 NiCAD's and a charger.

3366. VOX clipped syllable fix

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-26 00:00:00 UTC
From: DJohnson@DJandAssoc.Com
Message-ID: <7dgfr8$2ij$1@nnrp1.dejanews.com>
Source record: 72028

Many years ago an electronic technician who was working for me had an idea for a product. He wanted to build a box that would be placed between a microphone and the microphone input of a radio transceiver that was equipped for standard push to talk operation. The device he had in mind would allow a radio transceiver to operate in a VOX mode and would prevent the delays associated with switching from receiving and transmitting modes from clipping the first syllable spoken. His device would use a bucket brigade charge coupled device as an analog delay. When the person first spoke, a relay contact would switch the transmitter on, but the box circuit would generate a short delay between the actual speech into the microphone and the signals sent to the microphone input of the transceiver. With his device the transmitter would be switched on before the speech signals arrive. His device would give hands free VOX operation without ever missing the first syllable. My question is, this idea sounds like something that more modern radio transmitters may already have built into them. Do the latest radio transceivers have such a feature?

Hey Ryan,
If you are running such low power, it might be best to feed your antenna with 450 ohm ladder line or something similar. It has substantially less loss over distance than coax, but you will need a balun or a balanced line tuner to handle it. Even if you go with coax, at miliwatt levels you want to go with something at least *better* than 58. For almost all of my 100W HF work I use RG-8X It has lower loss than the 58/59, and it still comes in a small package.

Good Luck and 72,

Gray KE4QIU

Source record: 71843

The ammount of power does not matter. The ammount will be reduced
by the same ratio if it is 100 watts or 100 miliwatts. I would use
atleast the rg-8X type coax for 2 meters for that ammount of coax.
Even if you go with the rg-58, you wiii be beter off with an
external antenna up 20 or 30 feet than the antenna that normally
comes with a HT. The coax will loose about half the power, but the
antenna will give that back plus some and the height is more
important. I would normally have twice hte height even if I only
had 1/4 the power at the antenna.

Ryan

First, thanks for not giving up on Ham Radio!

To answer your question (you've provided enough
information by giving the frequency, type of coax
and length) I would suggest you look in any of the
ARRL handbooks that have data on coax losses
at various frequencies. RG-58 is a particularly poor
choice for VHF, it will have appreciable loss, even for
a fifty foot run. 3dB of loss is equal to 1/2 of your transmitter
power, or 1/2 of your received signal lost as heat!

I would suggest at a minimum you use RG8X (if size is
a problem). You will be gaining a lot by moving your antenna
out of the house and getting it up high and in the clear, so whatever
power you save in coax losses will only help you hear and reach out
further on simplex! There is another coax, 9913, that has a very low
losses at VHF.

3384. Spectrum Analysers (Marconi TF 2370 Series)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-27 00:00:00 UTC
From: Ken Linney <ken@g3uda.demon.co.uk>
Message-ID: <ufH3CAAAZS$2EwcM@g3uda.demon.co.uk>
Source record: 71846

Hello All

I'm reliving my youth! Am gradually trying to get together
various useful bits of test gear so as to restart an old HF transceiver
project.
I am seriously looking to spoil myself by obtaining a spectrum
analyser. I have been looking at a Marconi TF 2307 (normally they range
from 30 hz - 110 Mhz without the extender but one I have seen is a
special that covers up 200Mhz). I also have to consider the bandspread
of my wallet ;-)
Has anyone had experience with them please, any general
comments, WWW sites, a spectrum analyser FAQ perhaps. I have looked but
could not find much gen.

Many thanks ..
... Ken

> rg-58?

RG-58 is quite lossy at 2m compared to the larger cables, with
RG-58 having about 7 dB loss per 100 ft., vs. about 3 dB per
100 ft. for RG-213 ... there are also even lower loss cables
such as Belden 9914 (which is about the same size as RG-8/RG213,
but considerably stiffer).

In short, with 50 ft. of RG-58, you'll have at least 3.5 dB of
loss, so you'll get about 67 mW of your 150 mW at the antenna.

With RG-213 at about 1.5 dB of loss for 50 ft., you'd get about
106 mW of your 150 mW at the antenna ...

The difference (between the two cable types) is roughly
2 dB ... you might notice some difference, it might be
hard to tell in your practical appliation.

It will depend on what sort of antenna the person at the other
end is using, path obstructions, and many other factors.

When you were on the roof with the radio, were you using the
J-pole antenna or a "rubber duck" on the radio (which I'm
assuming is an HT)??? If you were using the rubber duck, you
may well do better even with the higher loss of the RG-58,
since the J-pole will surely work better than a rubber duck.
(However, with that said, I'd spring for the RG-213 if it were
me.)

73 and good luck,

Gray ... I believe that Ryan is talking about 2m ... from an
HT to a roof-mounted J-pole ... I doubt that 450 Ohm ladder
line, baluns, and tuners were in line with his objective.

Exactly.

>I did a Wersi organ some years ago for a friend,
>and that one was quite an accomplishment; not for the beginner.

Heathkit made everything from ham gear to color TVs - as kits. Some of the bigger EF Johnson ham rigs of the '50s cost several hundred bucks (quite a sum at the time) and were kits.

I know of at least one kit that was actually built twice. Many years ago I bought a used Viking Adventurer. It had some rather oddball problems and some undocumented mods. So after some unsuccesful troubleshooting and circuit tracing, I simply took it completely apart. Checked each component, replaced some dubious parts, sorted, straightened and cleaned others, and then proceeded to rebuild it according to the manual. Worked perfectly after that. Anybody else ever do that?

"So nice, they built it twice".

Nope. But my first transmitter was a Viking Adventurer with
undocumented mods. (Not the one you rebuilt, though. It eventually
supplied critical parts for my second transmitter, which was
homebrew.)

Around 3 years ago I was shopping for a plug-in for my 140T (non-storage tube version of the 141T) at Dayton so I noticed that there were lots of 141Ts for sale. Seems to me that with plug-ins, they were going for a bit under a kilobuck (around 600 pounds). I'm sure someone can give you a more current price.

Source record: 71860

Howdy Randy.....I don't know your lifeboat radio by model number...but as a working shipboard R/O during the 80's and early 90's (they've dumped us now), I used to check and test lifeboat radio's weekly as required...some of 'em were ITT MacKay units...some were Skanti's and Marconi's....All were geared up for the following output into the supplied telescoping antenna.....500kHz transmit / receive A2 emission (morse), 2182kHz transmit/receive A3 emission (voice using the headset's boom mic) and 8364kHz A1 emission (morse) transmit but with a tunable 8mHz receiver.
These radios generally had 2 power supply possibilities, either the detachable crank (UGGGGGHHHHHHHHHH better be mounted solidly AND you better have had your Wheaties for breakfast when you transmit!) or a DC supply (sometimes wide ranging) input via a front panel connector. The DC connector was the preferred source when the radio was permanently mounted inside an enclosed lifeboat. The power output was low and varied
according to frequency used....there was an option usually for a long or short length antenna wire and the coiled up stranded bronze wire with the
weight attached is for throwing overboard or a counterpoise if you were marooned on that desert island! All those attached straps were to allow you (in worst case) to hump yourself over the thing and, taking care NOT to bite your tongue off, headset tethering you, to crank AND send with the panel mounted key (TRY IT heheh!). The other options on the front panel were for automatically sending out the morse (radiotelegraph) alarm signal (12 four second dashes) on either 500kHz or 8364kHz or to send the voice (radiotelephone) alarm signal consisting of an alternating 2 tone alarm signal on 2182kHz. There was a provision for also connecting the antenna output to an internal dummy load (normal stowage) which was used for testing. Instructions inside the cover of 'em all. It was quite surprising how far you could work with these things even in crank mode and we had quite a bit of fun sometimes with sister ships on Sundays (typical test day) when your fellow R/O's would hear you huffin 'n puffin and the little generator whining up and down as you "tested" heheh. The 8 Mhz receiver was surprisingly sensitive and many coast stations all over the world could be heard even on the whip. Lots of memories you brought back.

Message-ID: <36FDA3EE.2452@nbnet.nb.ca>
Source record: 71861

Howdy Ryan....your best bang for the buck would be to mount this little rig at the feed point to the antenna and remote its control....more difficult to be sure but your concern is very valid....50 feet of RG-58/U (plus or minus each manufacturers claims) is going to cause approximately 6dB of loss...plus some for your connectors (as much as 1/4 dB each or worse)...now you're down to 38mW AND have the added penalty of also having your receive signal level degraded by the same amount! You could opt for low loss large cables but then you face the physical dilema of mounting your little 150mW rig ONTO the end of the cable NOT the cable onto the rig :) Best of luck to ya!

Found a circuit diagram for a Motorola VHF receiver. It looks very much like AN/PRC-10, but covers the larger range. I am not certain about how much similar the receivers are. The Motorola receiver uses almost the same modules and valves, it is marked ISSUE F Part No.63E845727. 'AN/PRC-10' transceiver seems to have been manufactured in Sweden (which is a non-NATO country) as Ra105, perhaps the technique is not as secret as we were told when I was in the army 32 years ago....

I would be interested to modify the selectivity using readily available 455kHz ceramic filter. Circuit says "permakay wave filter", but 50kHz bandwidth may be somewhat too much - even for the antique 6m net.

>The "Q" I'm talking about refers
>to the losses in the ferrite core. Not the "bandwith" of the resonant
>circuit.

The are the same thing. The coil will have losses from core losses, dc resistance in the winding, skin effect in the winding, dielectric losses, eddy current losses for currents induced in the ferrite (negligible) and currents induced in surrounding metal (usually not negligible). All of these losses combine into the real part of the impedance of the inductor. At resonance, the shunt capacitance from the winding and any external shunt capacitance cancel the inductive reactance, and you are left looking at a pure resistance which is solely from the losses. The -3db points are where the magnitude of the reactive impedance of the (ideal) LC tank equals the resistance. So when you measure the 3 db bandwidth to get the Q, you are measuring all the losses. You can measure the DC resistance, and you can calculate the skin effect loss for the winding, but it is very hard to separate core losses from eddy current losses. I've seen one paper which reports that the typical Q degradation from moving a magnetically "open" inductor from free space to the vicinity of other electronics and a chassis is typically on the order of 50%.

To answer your last question first, in a word, no.

I too have considered the bucket brigade for just such a
purpose. I have a homebrew electronic Morse keyer (with
memory) that I used almost 20 years or so ago in my
two-meter moonbounce station. To protect the sensitive
preamp, it was necessary to ensure relay changeover prior to
the generaton of rf. The keyed data is passed through a
shift register that is used as a delay element. The first
keyed character also begins triggering a retriggerable
oneshot that controls the changeover relays. The (delayed)
code out of the shift register keys the transmitter. After
the message ends, the one shot holds for a bit then drops
out the relays. The clock speed for the shift register was
adjustable and controlled the receive to transmit delay,
while the time constant of the one shot controlled the
transmit to receive delay.

I envisioned the same scheme for an audio device, bought the
BBDs but never finished it. Should work just fine but as
you can see, it's not a new idea.

3409. Re: 572B Driving Impedance?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-27 00:00:00 UTC
From: bpn518@aol.com
Message-ID: <19990326234012.29285.00000683@ng18.aol.com>
Source record: 71956

Hi Marty,
I am going thru the same thing myself, as
I am trying to convert the sb200 with
572b's to a 6m amp.

According to the ARRL handbook,
the tube imedance is equal to the
plate voltage (2100V?) divided by
the product of the Plate current you
will be driving (about .5A) times the
constant (in AB grounded grid this
is 1.5). So you get 2100/(.5 * 1.5) =
2800 ohms.
It would be nice to check something
close to it in a book, but the ARRL
handbook doesnt say what the Plate
to plate impedance is.
Hope it helps. (hope it works).
I still have trouble getting the right
values of the tune cap and coil for
right resonance for 6m.
Good luck.

Bennett ko2ok,

Hello all I am trying to get the hang of microsim designlab ver 8.
Is it possible in a circuit to specify the min and max values for
a passive component such as a capacitor then tune it and
see the results update via probe...

Right now every time I have to change the value then re simulate..

any help woulb be appreciated..

tia JD..

Brian thanks for the excellent help I really appreciate it.
I did as you said with the {set} but found in designlab 8
that I did not require the curley braces Perhaps they changed
something from a previous versions.... They also include a pre
canned symbol for the param function called parameters.

This is pretty cool it works good... I guess you have been using
p-spice for awhile... I am curious have you done any rf based
work with it.... Right now I am trying to design a simple buffer amp
for a vhf oscilator using a 2n2219a mot transistor...

Do you know of any books that would be good for a novice like
me to get so as to get up to speed with the tool... I am interested
in using the tool for some RF based simulation..

thanks again JD

Considering some of the kits that have come and gone, "kitbuilder" isn't
exactly pejorative. :-) I did a Wersi organ some years ago for a friend,
and that one was quite an accomplishment; not for the beginner.

Not exactly a homebrew question, but what's good to use to lubricate an old vernier drive? I just acquired a Yaesu FRG-7 receiver with a sluggish tuning vernier.

Normally, for a light, non-gumming lube, I use Singer sewing machine oil, but I'm not sure if that's appropriate around the tuning caps if the vernier (whose construction I never understood) manages to leak.

"A Smooth Voice Controller", in the April 1992 issue of QST, describes
a CCD bucket brigade delay line-based circuit to permit the VOX and
T/R circuits to operate before the microphone audio reaches the rig.
Variable clocking permits delay approaching 0.1 second if you needed
that much. A&A Engineering makes a PCB. It works very nicely and
provides something close to "full QSK" on SSB.

The CCD is VERY expensive, nearly $50 in 1-piece from Digikey,
probably because there is not high volume in this technology today.
One could almost justify a codec and DSP processor to get the same
delay, and have a microphone equalizer "free".

I have a low power 150mw transceiver that I have been planning on connecting to an external antenna. I have tested the hieght (me on the roof with the radio) and I can reach all around town on 2m simplex. But today as I was getting the coax to run to a J-pole I questioned what the outcome might be when all said and done. Will the very low 150mw make itself all the way to the antenna? From where my radios are it takes 40 to 50 feet of coax to make it to the roof. Also do I need to go with something larger the rg-58?

Thanks for any help or comments you can give!! 8>)
Ryan KB5UUS

PS. Thanks to all who stop in this newsgroup and take time out to anserw questions! In the april 99 of CQ VHF there is an editorial about a two new young hams who were having trouble getting help from their local hams in Chicago. I know how they feel. When I first got my ticket at 15 I never was able to get help from the much older hams. At club meetings I felt like I didnt belong. That resulted in me putting my radios away until about a year ago. Now when I come to this newsgroup I see many hams helping others and I think thats great! I am sure that if I could have come to this newsgroup to get the help I needed the radios would have never been put away. One thing that bothers me. When asking questions on the local nets I am now getting help and lots of it. Is this becuase my voice is deeper and I sound older or have all the old farts died. Remember not all young hams have ham parents. I never saw a ham until I went to take the tests. So with that if you see or hear a young ham out there go out of your way to help them and make them feel welcome.

Well thats just something I had to get out. 73's and thanks again to all that take time out to help young and new hams.

I have a TI 320C31 DSP starter kit. I haven't seen much TI stuff
around on the internet; most/all of the stuff at tapr.org is for
the Motorola 56K chips.

I'm interested in CW filters and FSK filters mostly.
Has anyone seen any source around?

I've tried generating FIR filters using software, Matlab etc,
and put the generated co-efficients into the FIR.ASM example supplied.
Sometimes this works but mostly I get silence out. I haven't experimented
with it a lot though.

>I know how Class A, AB, and C are biased, and the rough operation of
>each, but what are the Class D and up amplifiers? From my

An active device is operating in class D when it is used as a
swictch. The idea is to drive f.x. a mosfet with a square wave
with the frequency that you want to transmit. By doing that
you switch the device from fully conducting (that is 0 voltage drop
over it => no dissipated DC power) to an open circuit
(no current flows through the device => no dissipated DC power).
Ideally this should result in 100% of the power being transmitted
to the load (f.x. an antenna).

A square wave has many harmonics of the basic frequency so a
LC tank (and more filtering probably) is needed in the output
to select the frequency (usually the fundamental harmonic) you want to
transmit. These amplifiers/switches are usually high level modulated,
that is by changing the DC voltage from the power supply.

Work on these kind of amplifiers was pioneered by
N.O. Sokal. I think published his article about class D/E amplifiers
in "IEEE Journal of solid state circuits" in June 1975.

A friend of mine built an amplifier like that few weeks ago.
It was about 96% efficient he told me (although only with output
power of 1W :)

Take a look at http://eustice.caltech.edu/mmic/full/davisfull.html
for an example.

Source record: 71974

The Holtek 8955A "voice echo" chip offers a practical alternative to the bucket brigade device. It's available for about 5 bucks (page 160 of the TechAmerica catalog), and with the addition of a two-dollar DRAM chip you can have 10-bit audio quality with an adjustable delay of up to 0.8 seconds. I've built a delayed VOX circuit using this chip and it seems to work just fine. However, a PCB layout with lots of bypassing/decoupling and a good ground plane is advisable to keep the digital noise out of the audio output.

Ryan:
It would be better to use something other than RG-58 on your run. If it is the only thing you have on hand then use it but you may not have the range you need to hit a distant station. I do not have the figures of loss for RG-58 as I write this (I am sure someone will post these) but I would suspect if you just want to chat on the local repeaters it may work out for you. My advice would be to try and get the best quality RG-8 or Beldon 8214 for your run. Good luck Ryan.

> hinks@execpc.com
Try www.communication-concepts.com who sell a kit (EB104) for a 600W amp
for 6W input (4x MRF150's). They sell only the bare kit, you'd have to
supply your own filters and 50V power supply.
The filter parts can be had from www.surplussales.com (Surplus Sales of
Nebraska).
When I again have time, I shall have a go at completing mine. The
problem I have is with a warped heatsink that isn't a snug fit with the
copper heat spreader, a problem caused when I was trying to mate the
two, before I got a fellow ham's son to put the copper spreader under a
2-ton press.
I built a regulated 50V power supply, then I saw someone publishing a
2m Amp using MOSFETS and driving it from a supply with just diodes and
smoothing capacitors (like a tube amp), I can't even remember a choke in
line.
Anyhow, both companies advertise in QST and 73 Mag.
Best of luck....73....G3VBV.

Hi Shawn!

You've gotten several good explanations, but here's another way of looking at amplifier classes that might be helpful. (Please forgive any over-simplifications)

Linear amplifiers, like class A and Class B/AB, try to reproduce a true copy of the input signal, with more power, or more voltage, or more current into the load.

Non-linear amplifiers for CW and FM output, take a different tact that relies heavily on a well-known phenomenon of tuned circuits. If you ever took a college level "Fundamental AC Circuits" course, you would have been exposed to the following experiment.

Take a series or parallel LC circuit. When you apply a step voltage to it (usually by switching battery in or out with a mechanical switch), while watching the voltage (or current) in the LC circuit with an oscilloscope, you will see a nice sine-wave which oscillates at the natural resonant frequency of the LC combination. If there were no loading and no losses in the circuit, it would oscillate forever, but because we have a load (the oscilloscope, or any resistances in the L or C, or any load resistor), it "damps"; that is, it oscillates at the natural resonant frequency, and decays to nothing, usually within a handful of cycles. The more loss (or load) there is, the quicker the oscillation decays.

If you could switch the mechanical switch at (or close to) the natural resonant frequency, you could "tickle" the LC circuit's natural oscillation to keep it going. You could also extract some power from it (for your speakers, or antenna, or other load circuit), making it "damp" or decay more, but not so much that you don't get a full sine wave for each tickle.

Here's where it gets really interesting. It turns out that you don't necessarily have to switch the switch on or off very long. Sometimes, only a small percentage of the entire cycle. So you can "tickle" it only a tiny bit (5-45%, typically), and the resonant LC circuit will naturally provide the rest of the waveform. Hey! Switched pulse (digital signal) in, sine-wave out!

Turns out some devices, like Power Mosfets for example, don't take much power to drive, and are well suited to acting like switches. So you drive the input of a MosFet switch with short pulses at the rate of your LC circuit, and put the LC circuit in series/parallel with your switch, and take as much power as you can from it for your load (antenna). If you make the switching time (pulses) as short as possible, only as long as you need to replace the energy you're taking out of the LC tank circuit, you'll have a maximally efficient design.

As others have mentioned, these amplifiers can be very efficient (up to 95%, although 70-80% is more typical). Unfortunately, there are lots of variables, mostly in component characteristics, which degrade the switching, or make it difficult to get power out of the LC circuit efficiently. Also, some portion of the switched pulse itself tends to make it into the output circuit, and to the extent it does, it needs to be filtered out. Mostly these are odd multiples of the switching frequency, so low-pass filtering can remove the unwanted energy, but it still contributes to the overall losses, and reduction in efficiency. Still, for single-band RF amplifiers at HF frequencies, these type amplifiers are quite easily within the realm of the amateur homebrewer, and well-worth the effort for CW and FM.

(As an aside, you can make *very* efficient regulated and unregulated power supplies using these principles, using the inductances in a transformer, and resonating them with a capacitor to form the tuned circuit.)

By the way, low-pass filters are just re-arranged resonant circuits (yes, somewhat of an over-simplification), and can be used to provide the same effects as a resonant LC circuit, albeit less efficiently. But if you want really high efficiencies, you probably need to stick with resonant LC tanks. Hence, most such amplifiers with efficiencies in the 80-90% range will be single-band amplifiers.

Have fun with your amplifiers! And let us know of your homebrewing progress and success!

Marconi TF2370

Hi,

The TF2370, if my memory serves me aright, was built to a Royal Navy specification but was also sold in largish numbers into the private sector. It probably didn't penetrate the U.S. market very much and so will not be well known there. IMHO it is a superior instrument performance-wise to the HP140/141T, possibly because it is of a later design and uses refreshed screen memory with a bright, white TV display rather than a long persistence phosphor or storage tube. We switched some time ago to Anritsu together with some of the HP8xxx series machines.

Having said all that, I don't like the machine myself very much although we still have several in service here on our test jigs for IF and filter alignment. I have found their operation to be not particularly intuitive and the plethora of buttons for sweep and attenuation settings something of a pain. In my experience, it is not one of those instruments that you can walk up to and use straight off or setup easily first go.

From a maintenance standpoint, our calibration and repair facility keep them going OK although Marconi occasionally claim that certain spare parts are obsolete and we have to go elsewhere. About the only part that defeated us recently was a frequency readout assembly but as that only had a defunct decimal point it didn't matter much.

Anyway, you pays your money and you takes your choice. I am sure though that there are folks out there who just love them.

It might be more cost-effective to make a weather-proof container for the transceiver, mount it directly at the antenna and to run control lines (audio in/out. PTT, etc.) down to the shack.

I don't mind sending a check since you can't get money out of a check.
What you need if you want to make money is a cheque.

Source record: 71878

Depending on the frequency and how critical your measurements are, you can make a very serviceable probe by simply connecting a carbon film, metal film, or carbon composition resistor to the center conductor of a piece of small-diameter coax (the other end of the coax to your spectrum analyzer) and probing with that. Use about 450 ohms (430 or 470, say) for a 10X voltage attenuation (20 dB) 500 ohm input probe, or about 4950 ohms (use 5.1k) for a 100X attenuation (40 dB) 5k ohm input probe, and so forth. You'll likely pick up more error from your ground connection than from the resistor. Keep the ground connection extremely short if you want quantitative results. It's best to touch the braid directly to ground right next to the point being probed. Also for best accuracy, use very short resistor leads and a physically small resistor such as a 1/8 watt. You could even use a chip resistor, although it would be fragile. If all you need is an idea of relative signal strength and a look at what's there, you can be more casual about it.

While you can still get a signal with larger value resistors, at some high resistor value the accuracy will suffer from coupling around it.

This really is how it's done. Tektronix sells a 500 ohm probe for hundreds of dollars (rated at several GHz) that's nothing more than a 450 ohm resistor (thick film) and a piece of coax. One of the tricks is that the probe tip surrounds the resistor, making the resistor part of the coaxial structure. And the coax itself is premium quality. But these refinements are necessary only if you need to make precision measurements at microwave frequencies. For HF or even into UHF, the coax and resistor will work fine if you're careful to keep connections very short.

I am a little surprised that these would be auctioned on Ebay (I was
not able to find the link quoted). The collector price for one of
these in working condition, and reasonable but not perfect
cosmetically is $5 - 10, maybe a bit more sometimes, in this country.
Add shipping and it is hardly worth the exercise.

BTW did this item sell and if so what for?

Came damn close with a few large Philcos and a few SX-28s. Not unusual when
restoring some vintage radios to have to completely strip the chassis, and
sand
repaint with grey primer and galva-coat. depends on the rust damage....

From: kenk@primenet.com
Message-ID: <7dlkqgho1@nnrp02.primenet.com>
Source record: 71888

Without (please) getting into the merits and demerits of radial-less vertical antennas, has anyone seen plans for one of these multi-band antennae anywhere? My antenna books all only cover the standard verticals with radials. My property has no space for verticals (or low-band dipoles for that matter) and I have a hard time justifying all that money for a commercial unit.

TIA

73, Ken W9NPP

Peter: I was gonna remain on the sidelines on this thread, but..... I am an electrician/electronics/maintainance man for the largest metal fabrication shop (so I'm told) in North America. We can punch, shear, plasma burn or laser cut ANY size up to say, 10 ft. square. We decoil, flatten, and shear one inch plate, or 16 ga. sheet metal, as the customer requires. Our presses run up to 2000 ton capacity, enough to create a 3 ft. square hole in one inch stainless easily.
My normal job task is CNC lathe/ milling machine/ laser cutter troubleshooting.

Any question as to why I build my own antennas/ homebrew stuff???

If your looking for verticals for upper HF, a Jpole should do good for you.
Otherwise, using a vertical w/ a groundscreen (10' X 10 ' copper screening w/
#10 wire soldered in X fashion, also solder the wire around the perimeter.)
connect a coil of 20' - 30' of # 8 solid CU. wire about 2 " in diameter & 1' -
2' long.
Connect this to the shield of the coax.
Use a shorting wire w/ alligator clip to short to resonance.

You can also use a tapped inductor for the driven vertical element.

I've never used this, but just made it up(Too much CAFFIENE).

Give it a shot, cant be much worse than no antenna at all.

Also, see if you can get an Antenna Analyzer for speedily finding the resonant
pionts for the different bands.

You can fashion some relays, once the final workings are figured out, but
remember that high voltages can exist at the taps.

>73's de Luis

BNC and N fittings are available in 50 ohm and 75 ohm styles. The
difference is the center pin diameter. You will trash a 75 ohm BNC
female by inserting a 50 ohm N male because the pin is larger and
will spread the female pin in the BNC. If you try it the other way, 75
ohm pin in 50 ohm socket, the pin will be loose. So remember, only
mate 50 ohm with 50 ohm and 75 ohm with 75 ohm. That works.

A while back, I took some coax that I had scrounged up, stripped it down for just the inner braid, and cut off a piece that was about 1/2 wavelength for 2m. I took a pen, and poked it through the braid about halfway, and worked it around, so that the coax could slip over the BNC antenna mount, and give 2 radials. Even with it not being cut to proper length, and just hanging there, I noticed a significant improvement in TX strength--I could bring up some repeaters that I couldn't before. The RX was a bit better also (I know, I know, it should have increased the same amount, but I really wasn't interested in improving the RX capabilties, just the TX).

Hello, I have the following literature that is out of print,
and very hard to find. These are very high resolution LASER
monochromatic reprints of the rare originals. All are professionally
done with original style binding. All sales final on literature,
and I'm sure you'll be pleased. All prices INCLUDE POSTAGE, in the
continental USA. Others by actual quote.
Thanks, and if you need tubes, visit our sister screename,
Tubecntral@aol.com

TRANSFORMER BULLETINS/CATALOGS/MANUALS:

KENYON "Quality transformers",23 pages,has some writing in numbers
on the front cover by the original owner,but a real information
getter. Covers ALL transformers available in Dec.1st,1941.
Even has the "blown in" price update sheet! Price $9.00.

PEERLESS Transformers, Catalog 1948 - 1,original owners name
on upper right hand corner, nice info, not perfect but nice,
Price $8.00.

SNC Transformers, January 1, 1947,13 pages plus original owners name
spelt on upper right hand corner,beautiful copy, has "blown in"supplimentary
catalog page,price sheet, and August price update sheet! Price $8.00

STANCOR Essex #2,069,42 pages, a REAL NICE MANUAL/CATALOG,has EVERY thing!
A real good info source,Price $10.00

STANCOR Essex Catalog # 140 H, 21 pages plus Numerical index and
October 1, 1948 price update list, very nice, $9.00

THORDARSON "Transformers by Thordarson, No. 400-FX 1942, A beautiful
source of info, 27 pages, Price $9.00

THORDARSON 1941"Tru-Fidelity by Thordarson, an UNBELIEVABLE catalog, real
nice pictures of early Broadcast transmitters and an excellent source
of audio info, 19 pages,real nice. Price $10.00

UTC Transformers, reactors, filters, Catalog# 500,looks like early 40's
another real nice, illustrated Catalog/manual, 22 pages, Price $9.00

UTC transformer components, Spiral-bound Excellent catalog/manual,
really in depth, Bulletin# PS-405,)ct. 15, 1941, includes "blown in"
price update for Dec. 6, 1946.Another excellently illustrated info
source, 34 pages, Price 11.00

EITEL-McCullough's "THE CARE AND FEEDING OF POWER TETRODES", 1951
25 pages crammed full of information IN DEPTH! Has everything you
ever wanted or needed to know about running these tubes, a real

nicely illustrated easy to understand manual, Price 10.00

Thanks for reading, if you have any questions or need to order,
Please respond to my mailbox...
Thanks, Joe Pratt,

1) A friction brake - when not energized, the motor armature drops by gravity onto a brake pad. The resistance to the motor turning is multiplied by the gear ratio to prevent the antenna from turning.

2) A wedge brake - A spring pushes a steel wedge into grooves in the rotor housing. During rotation, an electric solenoid pulls the wedge clear of the housing. Hygain uses this method. You may be able to find some drawings on the Internet - Hygain page or Rotor Doctor perhaps.

it seems rather unlikely you have any experience using tuned LC
circuits at all. If you wish to build a 800Hz tuned circuit with 88mH
and 0.47µF, and it resonnate at 300Hz, you must have picked a 3.2 or
3.3µF capacitor.
I have built many lousy active filters, they measure fine, but in
practice they don't give much help, ear selectivity is difficult to
improve, but most passive filters have been quite successful, I stick
to those; ex-telecom inductors are cheap, 88mH toroids as you have in
USA, and the smaller 77mH pot cores which is the standard for pupin
coils in Europe. But for RTTY active filters seems to work quite
satisfactorily.

No, Gary, your are wrong. You will only trash a 75 ohm N female with a
50 ohm N male. 30 years ago I was happy to find many 75 ohm N
connectors used with video equipment, but wasn't so happy when I
started to use them, particularly difficult to understand why 75 ohm
cable connector give a 'break' in the feedline.
I use many 75 ohm BNC cables in my shack together with 50ohm, in most
cases the impedance does not matter for the short cables, some
atternuators are designed for 75 ohm, and they give quite little
measuring fault - even on VHF.
The only difference I could see between BNC connectors is that the 50
ohm connectors have more PTFE

>. . .

Sorry, Monty, but I do know what I'm talking about. I helped evaluate the probes. They were initially designed for use with the TDS820 sampling scope (8 GHz bandwidth), which I designed the delay line compensation and trigger pickoff for. The probe tip is a gold-plated shell about the size of an M-16 cartridge. The inside is nothing more than a 450 ohm thick-film resistor (for the 10x version). I've seen lots of them up close and personal, assembled and disassembled, and worked with the folks who developed it. The probe has a rated bandwidth of 9 GHz. It's a P6150, and you can see the specs at http://www.tek.com/Measurement/accessories/, although they of course don't describe what's inside. I suspect that the P6158, is also constructed this way, although I wasn't involved in its development so don't know for sure.

Now, this kind of probe can only work with an instrument that has a 50 ohm resistive input impedance. This is the case for virtually all spectrum analyzers, as it is for high-speed sampling scopes like the TDS820, which is why I recommended it. It would definitely not work for an ordinary oscilloscope, which typically has an input resistance

of 1 megohm, shunted by 20 pF or so. Oscilloscope probes are much more complex, involving a good deal of carefully-designed compensation and even very special coax. (It's lossy to reduce reflections, and has carbon-filled dielectric to reduce triboelectric and piezoelectric effects, among other things.) I agree completely that cheap scope probes are often a very bad bargain, since they can cause you to troubleshoot problems that don't exist. I wouldn't begin to try making my own except for very crude qualitative measurements.

Ya do pick up a few things by working at Tek for 17 years as a design engineer.

B and AB are not linear in the true definition, but the distortion that they produce is at a tolerable level. The reason they are used is that they are more efficient than class A. If you wanted 2 kW , for example, with a class A amplifier it would be drawing 2 kw from the power supply at all times (when turned on). A class B or AB, however, would be drawing 2 kW only when a signal is present.

The low-pass equations and tables in the Handbook are good to 50 MHz.
Remember to allow/compensate for stray inductance and capacitance.

Plain ol' dipped silver mica caps stripped from an old TV set should work FB,
as will plain ol' solid-conductor copper wire.

There's a Japanese ham with an extensive home-brew web page -- I don't have
the URL, but it's linked from Harry Lythall's page and many others -- he has
a lot of 6 meter stuff, and you can borrow one of his filter plans.

Hello--
I recall reading an article describing a procedure to do this-- the author removed the HV secondary. leaving the primary intact. Then, the author wound a few turns of insulated hookup wire over the primary winding to measure the core/primary turns-per-volt ratio. From there, it became a matter of fitting the appropriate number of turns of wire of appropriate gauge to get the desired output voltage.

Cautions included:
1.) Not overloading the core's VA rating;
2.) Noting that the core VA rating may be overstated;
3.) Allowing for low line/high line-voltage tolerances on the output winding's voltage.

That's all I can recall-- further comments, anyone?

3482. Need circuit for reduction of noise squelch

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-29 00:00:00 UTC
From: lrbrandt@statestreet.com
Message-ID: <7dob5keok1@nnrp1.dejanews.com>
Source record: 71784

Hi All,

I need a cicruit that works as a noise squelch. It would use the random pink noise that comes out of a receiver and when this noise is reduced by X amount (or eliminated, if full quieting) I would get a digital (1/0) indication. When the signal was gone and the noise returned, the indication would be "0".

This would run with the built-in squelch of the receiver wide open. It would not _actually_ squelch the audio, I don't care about the audio, only that a signal is present.

I remember a similar circuit, one that used a meter to indicate the amount of noise on the signal. This was used for fox hunting by inverting the indication (i.e. all noise=0% on meter, no noise=100% on meter.)

The circuit I'm looking for would would work in a similar manner, except that the threshold that the 1/0 indication was given would be variable (like a regular squelch).

If anyone has this book (it's called "Transmitter Hunting & Radio Direction Finding" - or something similar) [I have one _somewhere_ but have been unable to find it!] please let me know and we can arrange a way to get me the schematic (it's simple enough to use ascii chars so we could email it!)

Thanks es 73,

Larry

I am surprised to see this mentioned, just wonder who is stupid enough
to use electrolytics in tuned circuits? On the other hand it does not
prove that if such capacitor was used could hit 300Hz instead of 800;
using proper value capacitor, the range with 0.47 F and 88mH might be
710-1045Hz, another problem is unlinearity

A local amateur used disc ceramic capacitors and had a struggle to
catch up with frequency drift of his RTTY converter. Another used
pin-up capacitors in VFO, and later he wrote a long article to tell
how instable normal tuning capacitors were compared to varactor
diodes. With such components a digital C-meter has only illusionary
mission

Yes, but such arguments should not be used when showing some simple
filters which will not work satifactorily - popular filters are easy
to build, but may not have any valuable improvement. I am very
satisfied using DSP-59 for 1.8-2320MHz CW/SSB operation

Brad,

Just to elaborate on your first caution: mind the duty cycle! Microwave ovens usually run a minute or two, or twenty, but not continuously. While it would seem reasonable to assume that the transformer in a 600-watt is capable of 600 VA, the fact is that 600 watts is only on part of the time. It's most likely NOT 600 VA continuous.

And for goodness sake, be CAREFUL of those filter caps in the oven! Those things hold enough charge to make some serious holes in a big screwdriver. They'll think nothing of poking a hole in your fingertip, or your EKG trace.

Other than that, it seems like a decent idea. Maybe one can get cheap enameled wire for the new secondary at a motor rewinding shop. My uncle used to be a maintenance supervisor at a power plant, and he used to bring me "burned out" motor windings for the wire. The wire was usually fine, just burned away where it was attached to the terminal.

Larry,

I have the book, by Curlee and Moell, but not right here with me. I'll try to remember to dig it out tonight and locate the schematic.

One trick I've seen in Motorola's literature, used by their FM receiver chips (some of them, anyway), is to detect frequencies above the voice passband (I think they used 10 kHz) with a fairly narrow op-amp filter, and use a simple envelope detector (aka diode detector, just like your old crystal radio) to sense the presence or absence of noise.

This -does- require that you connect the detector ahead of the audio amp of the receiver, or at least ahead of any low-pass circuits. If you don't want to tap into the receiver's internal circuitry, you could try sampling at the speaker output and try to detect something within the audio passband but that isn't going to be very common. You may get some false trips that way,

however.

Sorry about the long time before I responded...

Anyhow, if what I was describing was a class c amplifier (it is switched
so that it is either on or off) is in reality a class d, then what is
considered a class c? The amplifier that I am building was designed as
a class c; no bias of any sort on the final. Just driven as hard as
possible when "on".

Very interesting webpage; thanks for the link. The resonant circuit in
the output filter (Ls and Cs), is that for filtering or is used a
resonant circuit somehow? I mean, a resonant circuit only passes
frequencies inside of its passband (attenuates the others, amount
dependent upon bandwidth); is this just a filter design to pass the
13.65MHz or is used somehow otherwise?

since second harmonic from 6m is likely to cause bad BCI it is a good
idea to use an extra halfwave notch filter integrated with the LPF,
the halfwave filter is quarterwave length on 50MHz and has very high
impedance. One end is shorted. RG213 filter may add some 40dB extra
attenuation

3498. Small BCB variable capacitors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-03-29 00:00:00 UTC
From: Dan Walker <SciCon@ix.netcom.com>
Message-ID: <7doqsr$mu8@dfw-ixnews7.ix.netcom.com>

I have one of the small variables that I took out of an old clock radio. There are several sets of plates and it looks like this was designed to be used for many different applications.

I'm trying to get 365pf out of this cap, but no matter how I wire it I can't get more than 330pf out of it.

Does anyone have any info on these caps? They seem to be in just about every radio I've taken apart, and I'd like to use them for receiver antenna tuners.

Thanks!

3499. Re: High impedance Probe

As usual, a bunch of different things have gotten mixed up in this thread.

The original poster seems to be looking for a high impedance probe, which to me means a FET probe. The most commonly available are the Tek P6201 (900MHz) and P6202/P6202A (500MHz). Both make excellent spectrum analyzer probes if you're careful not to burn them out :-) Typical price is $50-300. The P6202 comes with its own power supply, so it's most desirable if you don't have a Tek 7000 mainframe handy.

If the bandwidth and accuracy requirements are not too stringent (200MHz, 2-3dB?), a homemade FET follower probe would probably do the job.

A couple of other posters started talking about low impedance probes, which could be useful with spectrum analyzers, but are perhaps more commonly used for time domain measurements.

I'm sure the Tek P6150 described by Roy Lewallen is a fantastic probe, but don't turn up very often in the used market.

The earlier generation P6056 (10X, 3.5GHz) and P6057 (100X, 1.4GHz) probes are obviously adequate for most measurements around the home, and are sometimes available at reasonable prices ($25-35). Note, if the nose resistor on one of these probes is broken, it will be very difficult to find a replacement (at least I haven't been able to find one; does anyone have a source?).

3500. MESH DIODES ?

>chip around that is TTL compatible or does anyone know of a faster BCD
>decade counter ? Also what is the fastest variety 74S or 74F or other ?

The 74S196, 74F160/162, 74F168, and 74AC162/74ACT162 are all rated 100MHz
worst case. I'd suggest the 74AC162 since you can probably speed it up by
increasing the supply voltage to just below breakdown. Second choice would
be the 74F162 since it has the highest typical rating (125MHz).

Class B and AB do waste power when no signal is present, due to their biasing. Their quiesent current is what is the culprit here; the harder they are biased, the more linear they become but they also approach becoming class a amps.

Wow, what a variety of responses you've gotten!

I'm a little puzzled by the energy developed around a word-label.

When I'm in QSO with someone who says he built a kit, I applaud that person, pat him/her on the back, and laud her/him with as much praise as possible. If I built a kit, I wouldn't claim it as my own design, but DID I BUILD IT? You bet. At home? You bet. With my own two hands? You bet. Am I a homebrewer? You bet! Is it a "homebrew rig"?... well, it's definitely a "home-built" rig, and it's also a kit. Is a kit a worthy learning experience? Absolutely! Are they fun to build? Sure are!

Back 30+ years ago, I tried to "design and build" my own gear before I had the slightest idea of what I was doing. (My first homebrew rig was a 1-tube AC/DC-line-operated rig, which nearly killed me, and blanketed every TV within 5 miles). It was very discouraging. Then my elmer suggested I build some Heathkits, and some *simple* projects from QST. I learned to read a schematic and solder correctly, learned to select and/or substitute components, and learned basic troubleshooting. I read the theory of operation in the Heathkit manuals or the QST articles, and tried to make sense of them. Gradually, I gained experience and knowledge, and was able to build increasingly complex projects, and eventually made a career designing electronics. It got to be fun, and still is.

You know what? I still think I was "homebrewer" way back when I built that first killer-transmitter. Not because it was successful, though. Why? Because I had a homebrewer's attitude. You see, I think it's the attitude, and the willingness to do-it-yourself (if only partially), that makes it "homebrew".

I say "go for it!" (but don't try an AC/DC-line-operated transmitter ;-)

regards,
monty N5FC

Gary,

Hmmm... I was completely unaware that an "N" type plug was intended to mate in any way to a BNC plug; for one thing, the "N" type is a screw-on connector with a diameter of about 1/2 inch, and the BNC is a 1/4-turn bayonet connector with a much smaller cylindrical diameter. However, I must admit I've never tried to mate the two.

Secondly, I think you're partially mistaken about the pin diameters on the 50 vs 75 ohm connectors, at least in this respect: The MATING (i.e., contacting) portion of the connectors is the same on 50 ohm vs 75 ohm connectors of the same series. Behind the mating portion (where the soldering or crimping is done during assembly to a cable) is indeed different. Therefore, you should never have to worry about mating any BNC plug to any BNC jack, or any "N" series plug to any "N" series jack.

Mis-alignments, poor assembly, and el-cheapo connectors are more likely reasons for connector damage.

Weeeellllllll.... not really...

Probes, even cheap ones, usually have compensation circuitry (a
trimmer capacitor as a minimum) at the connector end, where it
connects to the test equipment. Sometimes, that circuitry is quite
complex, and justifies the expense. Occasionally, there are even
active devices at the probe end. Ask anyone who has tried to chase
down a bus problem on a piece of digital equipment, using an
oscilloscope. A poor or unmatched probe can seriously mislead you.

Nonetheless, Roy is right about the el-cheapo homebrew probe, provided
you're doing relative measurements on sinusoidal signals in a narrow
band, and at HF frequencies. Anything else, be *very* suspicious
about the results you see.

Hi Ken!

Well, the penance for getting an answer is that you have to listen to
the explanations (it is a homebrew / antenna newsgroup, after all)...
but if you just don't care about the "why's", skip down to the 5th
paragraph ("I'm sure there are...")

Not having a counterpoise is kind of like not having a return path on
your AC outlets. The voltage gets to the equipment, but doesn't
supply current to the load, because it has no return path to the AC
supply.

In the case of an RF transmitter and a 1/4 wave vertical antenna,
having a a counterpoise provides a matched return path for RF
currents, and allows the maximal portion of RF energy to get into the
load (which in the case of an antenna, means it is radiated into
space).

If you take away the return path in the case of your AC outlet,
chances are nothing happens (i.e., the equipment doesn't turn on).
But when you take away the counterpoise from a 1/4 wave vertical
antenna, there are enough stray reactances around that the RF finds
its own return path. The trouble is, these return paths are likely to
be through the power supply of your transmitter, back to the AC line,
to whatever ground the RF finds along the way. Usually very lossy
(meaning not much RF gets radiated from the antenna), and often
causing RFI/TVI, and maybe even RF burn hazards to the operator (if
you happen to be the most convenient counterpoise).

If you really don't care about all of this, stick your vertical pole
in the ground (with an insulating base), make it any convenient
length, feed it with a piece of wire, and tune it with a transmatch.
You'll get results comparable to a vertical with a poor ground and/or
no counterpoise, and at some frequencies, that will be pretty good
results.

I'm sure there are plans or kits or commercial antennas for 1/4 wave
verticals that claim not to need grounds or counterpoise. I've seen

them for 35 years, but I'm not buying, for the reasons noted above. Fact is, you can use the plans for any vertical you want.

Having done your penance, here's the solution I promised:

If you have good ground conductivity in your area (not sandy soil, and not gravelly soil), an 8 ft ground rod (or two or three at 5-6 ft intervals would be even better) will provide a reasonable RF return path for your vertical. Use copper clad rods for better conductivity (Radio Shack or your local electrical supply house will have them). Assuming you're mounting the vertical on the ground, put the first rod right next to it. Try to keep the areas around the ground rod(s) damp, by watering them about once a week. Don't use salts.

Lacking that possibility, have you considered one of the mini-loop antennas? They generally take power pretty efficiently, radiate surprisingly well, are very compact, and don't generally need a counterpoise (the return path in a resonant loop is inherent). They're a tad tricky to operate (they don't have much bandwidth, typically 10-15 KHz, so they have to be re-tuned a lot if you move around the band much), but if you can live with the operating inconveniences, they're a pretty darned good compromise.

Let us know how things work out!

>>The big problem is, the tolerance of components with enough inductance
>>and capacitance to resonate at (say) 800Hz is *really* wide.

Well, I was curious about that myself, so I cranked some numbers.

Typical winding tolerance on toroidal coils is +/- 5%. Typical tolerances on capacitors are +/- 10%, +/- 20%, or +80/-20% (for aluminum electrolytics). If you were building a resistive device, the component tolerances would "stack", or add, but since we're looking at resonant frequency, and the component tolerances are under the square-root sign, we'll add the tolerance, then square-root it. So for a +/-5% L and a +/-20% C, the resonant frequency will be within *approximately* SQUAREROOT (1 + (0.05 + 0.20)) - 1) = +/- 0.99 = +/- 10%

Real world example:

Let's try 88 mH +/-5% inductor and 0.47uF +/-20% capacitor. Given

fo = 2 * PI * SQUAREROOT (L * C) then for our example,

fo = 2 * PI * SQUAREROOT (0.088 * 0.00000047)
= 782 Hz (nominally, with exact values)

If both L and C are high by their respective tolerances:

fo = 2* PI * SQRT ((0.088 * (1 + 0.05)) * (0.00000047 * (1 + 0.20))

= 697 Hz (i.e., 9% low)

If both L and C are low by their respective tolerances:

fo = 2* PI * SQRT ((0.088 * (1 - 0.05)) * (0.00000047 * (1 - 0.20))

= 897 Hz (i.e., 15% high)

Not as bad as you thought, heh?

it never has been a real issue - unless you are discussing VHF
operation, a friend (LA6VBA) has 250m coax (using 28MHz IF) up to a
VHF/UHF transverter......

Everyone should have a digital C meter so that caps can be hand picked or combined. The one that I have is specified at +/- 0.5 % accuracy for values of 100 pF or greater.

Also, speaking from experience, I don't agree that active filters are not good enough. They can easily be made as good as you like, using only R and C components plus opamps.

I am trying to increase the max frequency of my oldish Gould TC12 counter (currently about 25 MHz) by replacing the first decade counter with a faster chip. Is the 74F160 or 74F162 currently the fastest BCD decade counter chip around that is TTL compatible or does anyone know of a faster BCD decade counter ? Also what is the fastest variety 74S or 74F or other ?

That is what I thought it was for; most of the output filters that I have seen are of the low pass response, not bandpass as that section would be. Although, if the components were of high Q, it would start to act sorta like a crystal filter, and really block the harmonics.

Which begs the question of me now, what are the effects of the upper harmonics on the amplifier? I mean, the amplifier wants to see a good, probably low impediance load (matched condistions); but the upper harmonics caused by the square wave drive do not see a good termination. The upper harmonics I realize are much smaller in amplitude, but are there any other effects to the amplifier (other than wasted power in the harmonics) due to these badly terminated harmonics?

Ah, I am starting to see now. It sounds like my amplifier runs more
like Class D, as it is driven off/on as hard as possible.

So, the class c *does* have some linearity to it; I imagine this type of
amplifier would be possibly good for amplitude modulated frequency shift
stuff? I forget the names of those wild wacky digital modes, but I
imagine that this would be an applicable usage.

Source record: 71734

Heath had a 2 meter transverter, in the late 60's called the SB500. It used two 6146's in push pull. I struggled with it for several years. Never even got close to the spec's power out of it (I don't remember the number now).

It is possible to use them at 2 meters but there would have to be a very large amount of money riding on the success before I would attempt it. If your time has any value, go to a 250 series tube or go all the way to an 8877 and skip the intermediate power levels.

for experiments I often must build high impedance 'probes' into the
equipment. It is experienced difficulties using simple FET circuits
because source-follower gain is low, somewhere in the region of
0.5-0.7, mosfets are better, but none can drive a 50 ohm line, it
would reduce the gain by another 6dB
To improve this I've chosen the combination of Dual-gate mosfet and
PNP transistor with heavy feedback to from collector to source.
Another difficulty is bandwidth, gain tends to fall 1dB on 10MHz, and
another 1-2dB on 50MHz

>
5894=QQE06/40
believe YL1060 is Philips valve, almost similiar to Telefunken YL1070,
but has not so much gain, and is not designed for linear amplifier as
YL1070.
While 5894 will run with 150WPEP o/p on SSB, YL1060 and YL1070 may
deliver 190-195W PEP output
Believe the screen voltage for YL1060 is around 300-350V with -30V
grid bias for class AB2, while YL1070 requires only 220-250V for -30V
grid bias
I use EL90/6AQ5 shunt-type screen regulator with 220-330V o/p range,
it was built 25 years ago, today I would suggest EL84/6BQ5 a pwr
mosfet, inrush protection and time-delay is also included in the
circuit.

I used YL1060 for a period in my 2m linear, but now using YL1070

Three pole toggle switches should be readily available from Newark,
Allied, or other wholesalers.

It was referring to an article in QSTNov 84*, copied and attached to
FT-newsletter, KY0A believes that meshdiodes are more quiet than
ordinary diodes, but I suspect it is a hoax from Hints&Kinks column.
FT980 was mentioned
Believe Yaesu re-invented the diode ring type product detector because
they had some problems applying PC1037H - which seems to be caused by
resistor values chosen. Changing few resistors will improve PC1037H -
as used in FT-726 (not for 736), and the RX sounds ufb on ssb/cw!

I borrowed the FT-newsletters from Edmund, DK3UZ, but I doubt they
have much interest today. Most of the articles is at a technical level
which can be compared to 'Hint&Kinks' in QST.

I posted this to RRS and RRAB but forgot you guys.

I have a Narco Nav Com MK 12A. It covers 135.95 to 118.00 in 50KC steps plus 108.0 to 117.9 in 100KC steps. Other controls are volume, squelch, and ident.

Tubes are 6ar8,6ea8,6bj6x2,6cb6x2,6bh6,6ak5,7551,8106x2,6cw4
This is a nice handful of tubes.
Also has a bunch of crystals.

I like to build things but have too many projects and a plethora of junkbox parts. So, while this unit has good parts, I'd like to swap it for a 100' roll of needed ladder line. 450 or 600 ohm and either the stuff with the little spacers or the windows. If no takers it will go in the 'to be robbed' bin.

I'll pay postage to you on this, you pay postage to me on wire.

You probably want to sequentially turn on the voltages anyway, so why not use a relay to turn on the +5 from the +15 supply which in turn operates a relay to turn on the -5 volt supply. SPST will do fine! Cliff K7RR

What exactly is a mesh diode? I have never heard of those.

Isn't the noise figure of a passive mixer simply the Johnson noise of an
equivalent attenuator? Could be wrong about that, but it's not clear
how one diode can be 'more quiet' than another, unless it delivers less
conversion loss.

That is an interesting idea, but I wonder why the gain (and bandwidth) of
your JFET source follower circuits was so low. Did you bias them at VGS=0?

If the FET can't drive a 50 ohm load, an NPN or NPN/PNP emitter follower
can be used without much more loss.

I don't have a copy of "SSDftRA" (yet), but this topic is not covered in our beloved "AoE".

However, the RSGB book "Test Equipment for the Radio Amateur", by H.L. Gibson, has a TTL frequency counter design that could still be built (substituting 7 segment displays for Nixies) and includes serviceable (if uninspired) input circuit designs.

The Motorola app note AN581 also includes some interesting input circuits. This is not on the web site, but is available from MFAX.

I have a Freeware G.G. Triode RF Amplifier
Prgram on my site you can download. It
will give you the driving Impedance plus Matching
circuit needed plus othe info.

You can generate a 572B *.dat file using the utility
program and a data sheet with the characteristic curves.

See T.A.P. 2.0 on http://www.imaxx.net/~kd9jq

Hi,

I am currently working on a PCB which has 3 AC voltages coming into it from a wall mounted transformer (with several windings). The 3 voltages are fed to Linear regulators to produce +/- 15 and +5.

The last version of this PCB just turned on when the unit was plugged in, but that is no longer acceptable. I need now to be able to turn on/off all voltages, via a front panel switch, with the wall mounted transformer plugged in.

I would think that I need something like a single-throw-triple-pole switch, if such a thing exists. Or, perhaps I could use a SPST switch to control one supply and then use relays to control the other two, but that seems excessively complicated. If the transformer were on board I could just use one high voltage switch to tuen on the whole thing but I can't change what we have.

I would appreciate a suggestion.

Thank You
Tom

Well, one solution is to use regulators which can be turned on and off
with a logic signal, such as the National LM3940 for +5 and +15, and
and LP2952 for the -15. Then, a small switch or a processor could be
used to turn the regulators on and off, rather than switching the AC
side.

>possible when "on".

Class 'C' is a *signal* amplifier which is biased (or not biased at
all) to conduct for less than 180 degrees of the RF cycle. In
general, the amplifier operates in the linear region of its operating
curve while it's conducting, and usually isn't allowed to go into
saturation.

Class D and above comprise "amplifiers" with *digital* (i.e., On/Off)
characteristics, that is, they act as switches, saturating for some
portion of the RF cycle, up to 180 degrees.

regards,
monty N5FC

3563. PSK31 Interface Kit

Newsgroup: rec.radio.amateur.homebrew

Right now, PSK31 is hot and getting hotter. On the suggestion of Tim, N8AHK, I've designed a nifty little pc board that will (when stuffed and wired) interface many modern transceivers to the sound card in your PC. It includes an adjustable audio amplifier to boost low level receive audio, a 100:1 pad for transmit audio, PTT keyer and LED transmit indicator. It is currently undergoing 'beta testing' between an ICOM 765 and a Soundblaster 16 but should work in many other setups since the main difference between rigs is just the accessory jack pinout and style. The PSK Interface kit would include pc board, parts and instructions. You would supply cables and connectors since every situation is different. Pricing would likely be well under $25 for the kit and about $25 for an assembled pcb. Is there any interest in this PSKI?
See the completed PCB at: http://www.cros.net/n8ahk/psk31.htm

Email: n8ahk@amsat.org

I have some used self-defense videos for sale.
I have placed a list of what I have on an autoresponder.
Just send an empty email to: 19992@smartbot.net and you
will receive a list in return. These are VHS, NTSC format.

Hi Mike,
As someone else eluded to,
there is a simple filter to build listed in
the ARRL handbook, at least as far back
as the mid-80's.
In my 1988 book, it is listed right after the
design of the 3cx800 6m amp.
Good luck.

Hello Richard, (or should I write "G'day"?)

I think every type of home construction deserves credit, recognition and
praise. Using "homebrew" as a blanket description is simply inaccurate.

And while I'm here on the net, I'm still building, fixing, modifying, and
designing my rigs.

The series LC circuit in the output is used to pass through the fundamental
frequency of the swictch (that is 13.65MHz). A series LC circuit has
a very low impedance on its resonance frequency so current can flow
freely to the load. Harmonic currents of the fundamental frequency
(mostly odd multiplies of the fundamental) will see a large impedance
and therefor won't make it to the load. The output will therefore be
a sinusoidal wave.

Larry,

I found the circuit you mentioned - do you have Circad? I could make a quick schematic from the book and e-mail it to you. ASCII art is a little out of my league.

(BTW, I highly recommend Circad for schematic capture and PC board layout. I've made one board with it so far, and it works well. Also, there are a number of ham radio project files on the Web that use it, so it's becoming an informal standard for electronic exchange of circuit ideas.

http://www.holophase.com

I am not associated with the company.)

Dave
